TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY Visualization

Organization

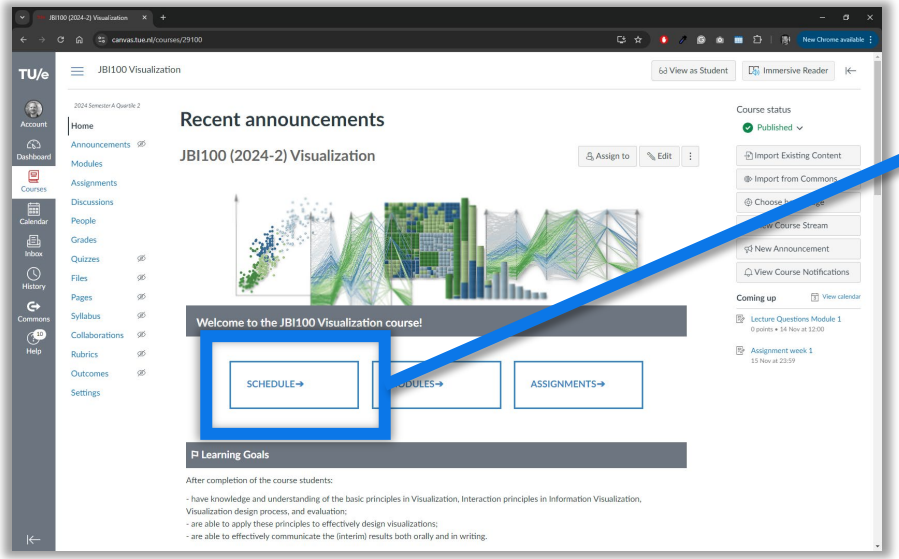
- Main information communication channel will be **Canvas**

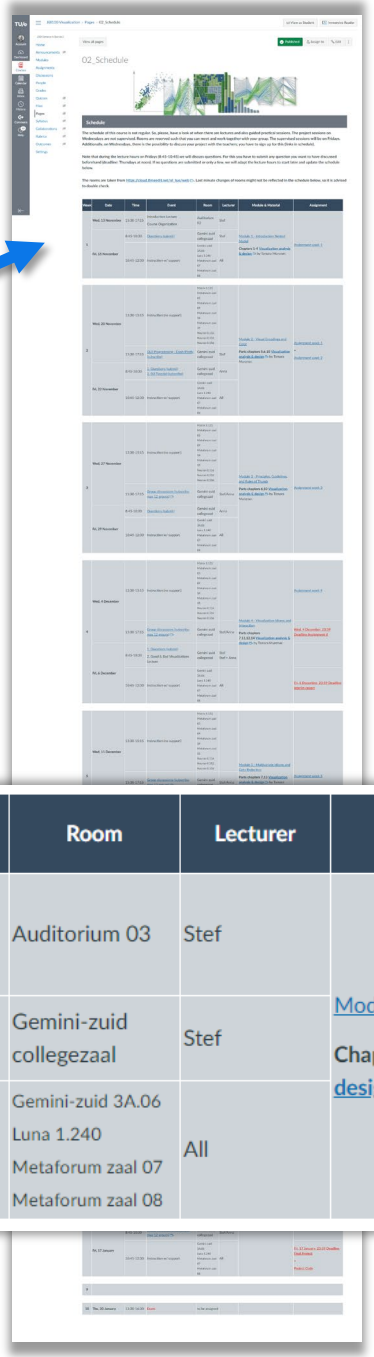
- **Lectures → Videos** (flipped classroom concept)
  Theory: Visualization concepts and principles that should be applied in the project.

- Some Lectures are Live
  - Programming tutorial Dash/Plotly + D3.js
  - Good/bad visualization discussion

Look at the schedule in ***Canvas***.

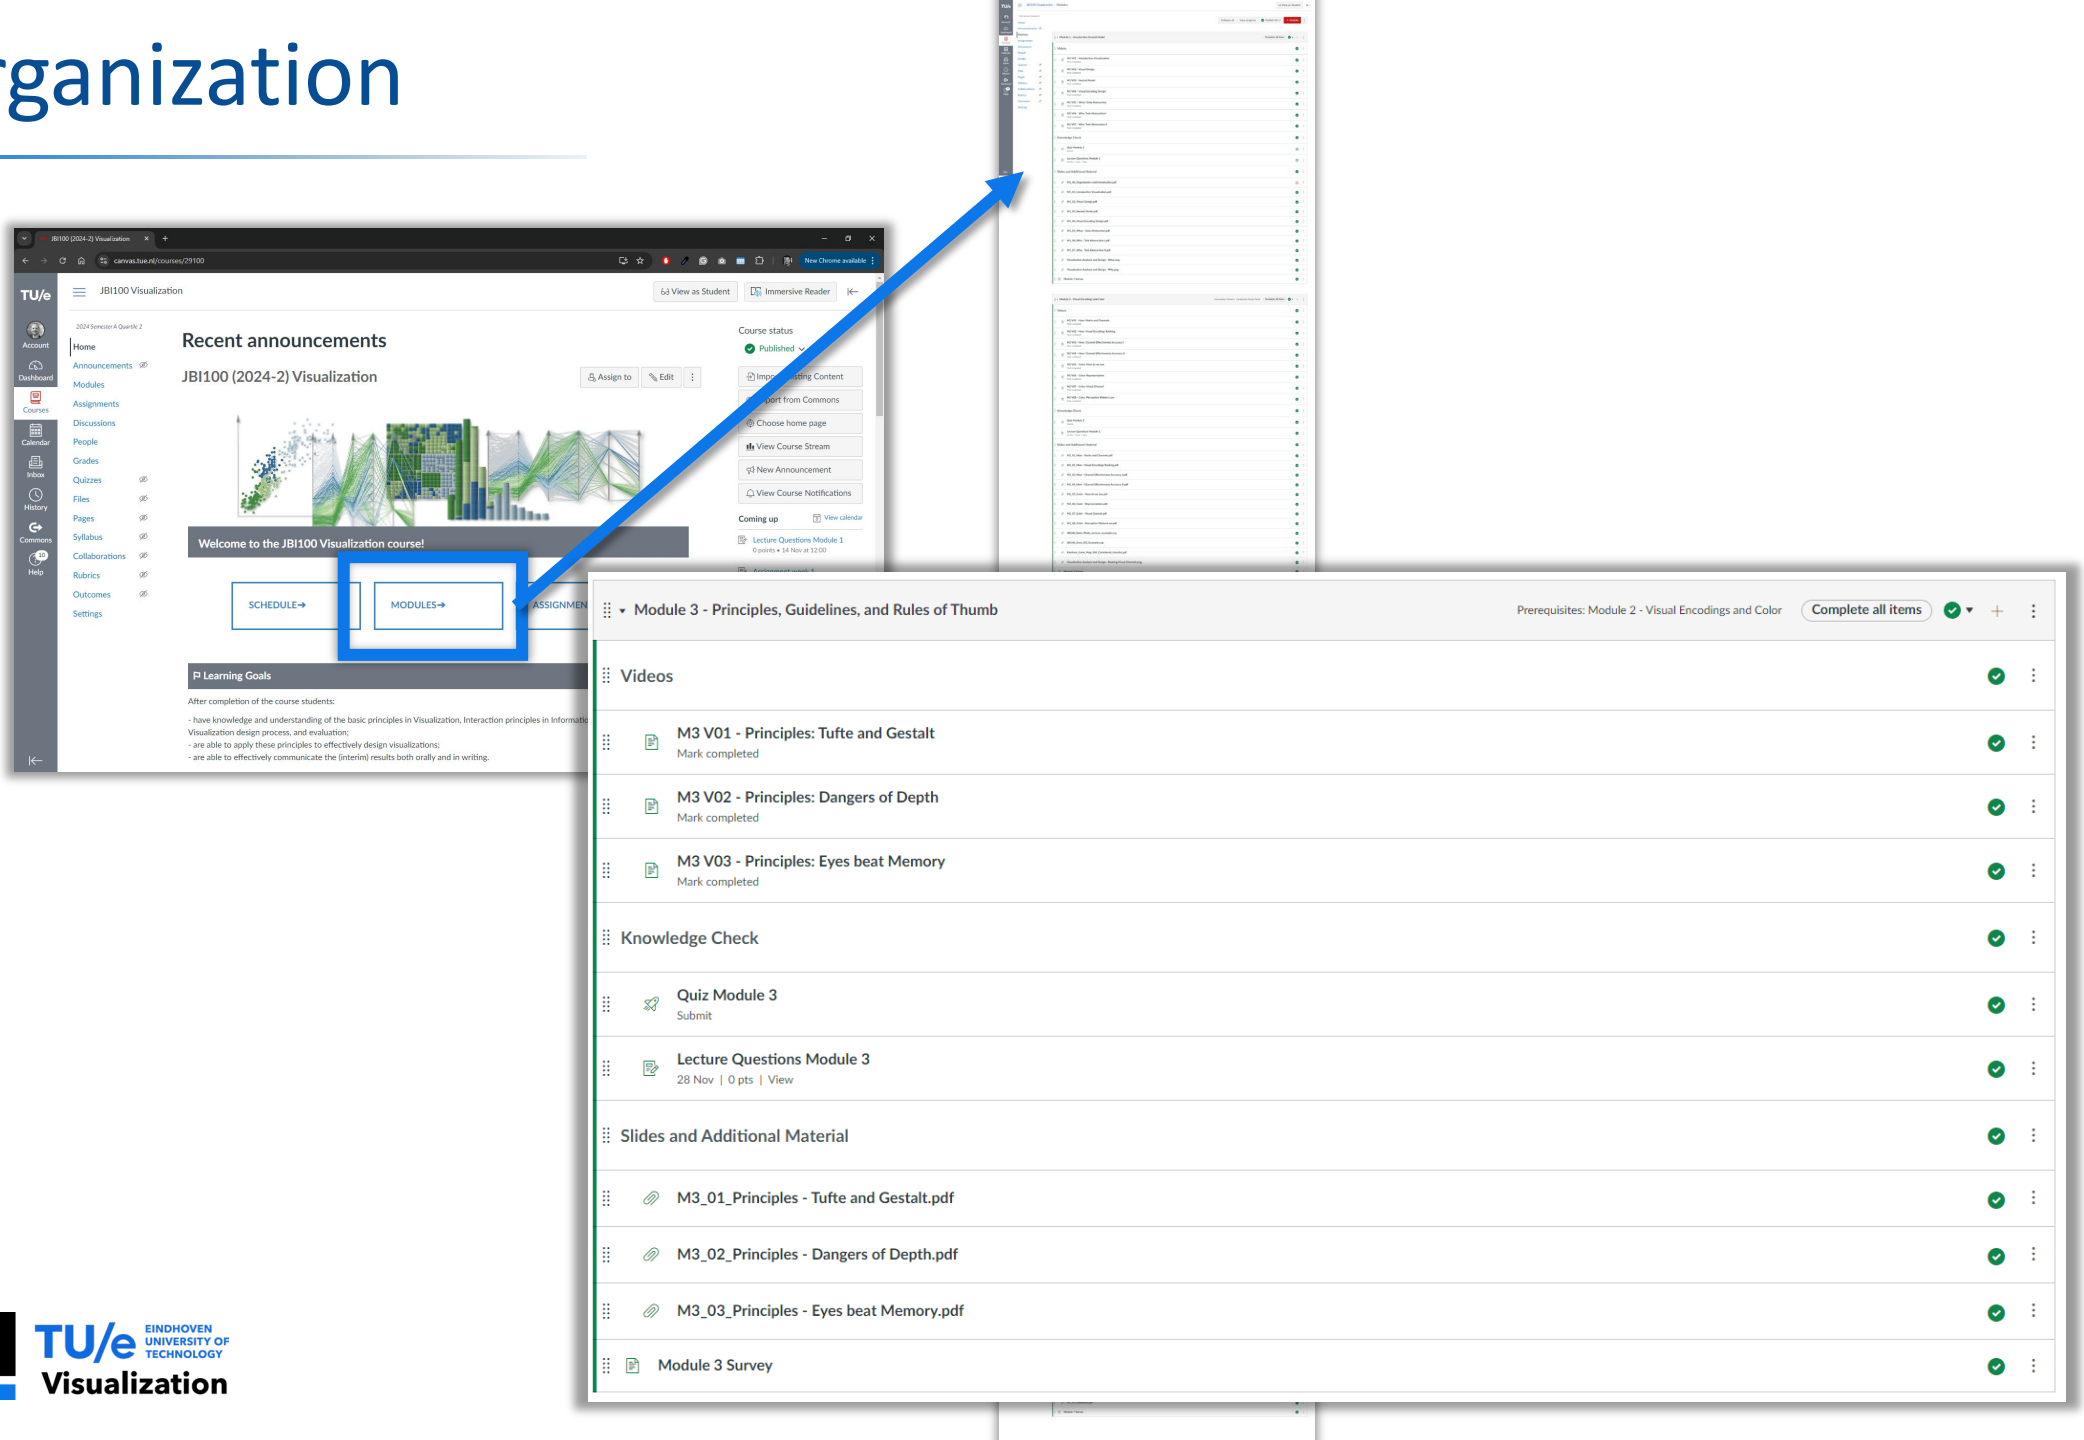
Organization





Week	Date	Time	Event	Room	Lecturer	Module & Material	Assignment
1	Wed, 13 November	15:30-17:15	Introduction Lecture Course Organization	Auditorium 03	Stef	Module 1 - Introduction Nested Model Chapters 1-4 Visualization analysis & design by Tamara Munzner.	Assignment week 1
	Fri, 15 November	8:45-10:30	Questions (submit)	Gemini-zuid collegezaal	Stef		
		10:45-12:30	Instruction w/ support	Gemini-zuid 3A.06 Luna 1.240 Metaforum zaal 07 Metaforum zaal 08	All		

Organization

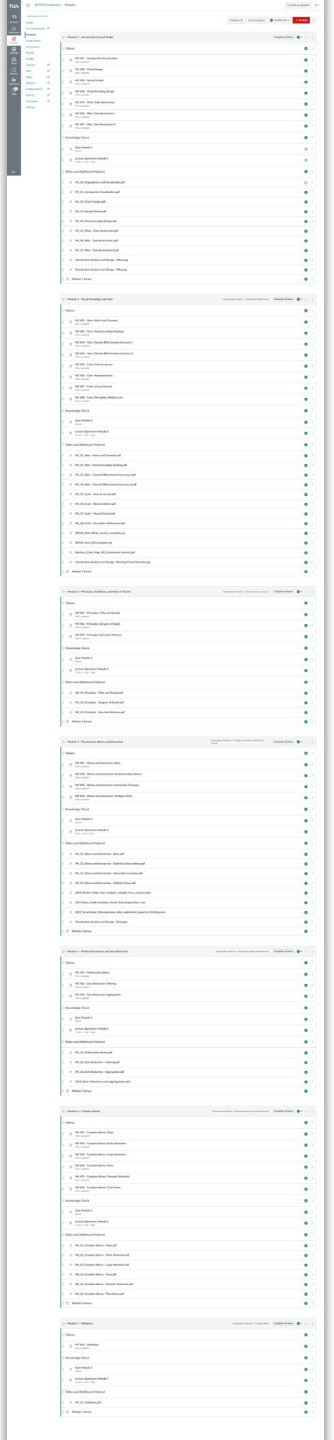


Organization Lectures

- Course is thematically organized in 7 modules.
- Each module roughly corresponds to one week.

- For each module
  - Study the provided material (videos, slides, assignments) at home.
  - Check your knowledge with provided Quiz.
  - Submit questions (deadline every Thursday at noon).
  - Attend lecture on Friday (and occasionally Wednesday)

- Similarities to *Data analytics for engineers (2IAB0).*
  - We go deeper into the design and the concepts + practical implementation.



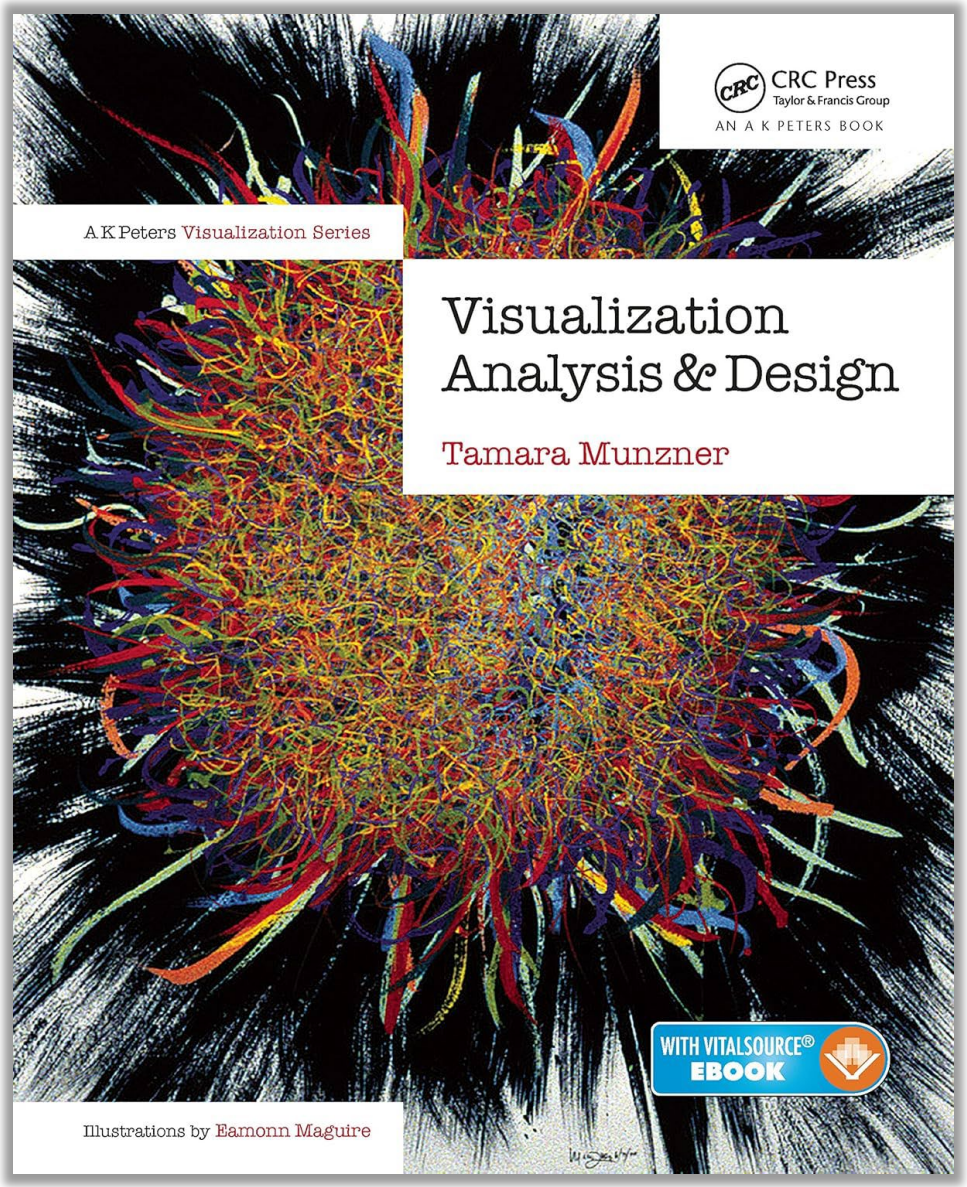
Organization Lectures

Course material

- Videos + Slides
- Papers
- Book

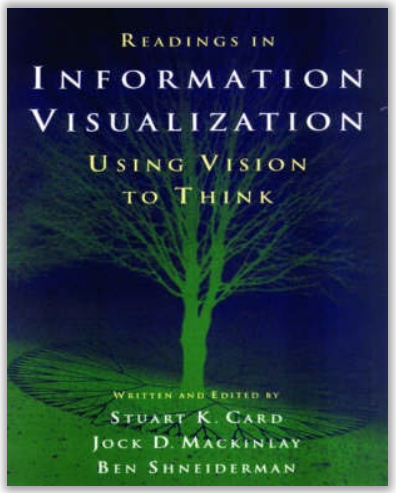
Visualization analysis & design
by Tamara Munzner,
eBook 2015
ISBN: 9781466508934

You can find the book at the library:
https://tue.on.worldcat.org/oclc/897069361

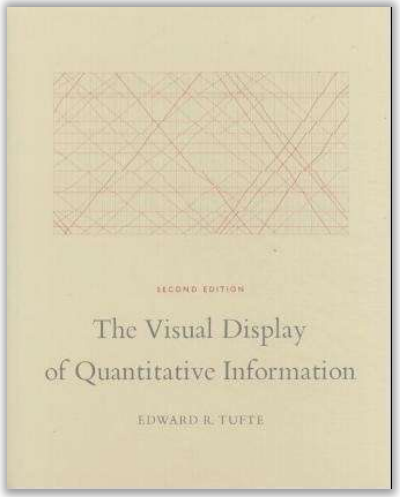


Other books

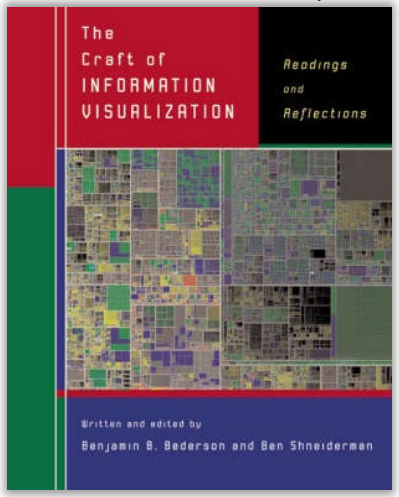
- Stuart K. Card, Jock Mackinlay, Ben Shneiderman (1999)



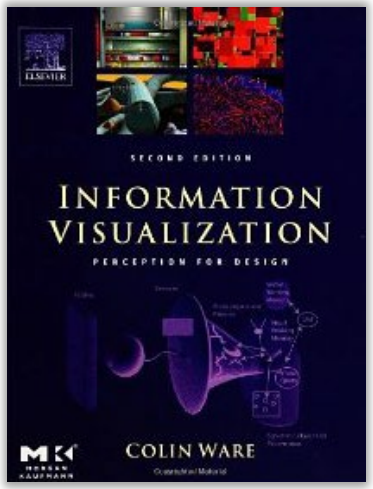
- Tufte (2001)



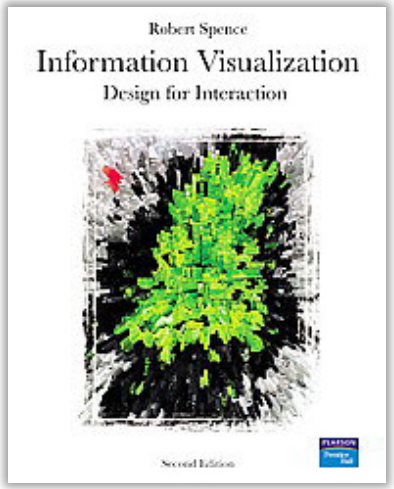
- Benjamin B. Bederson, Ben Shneiderman (2003)



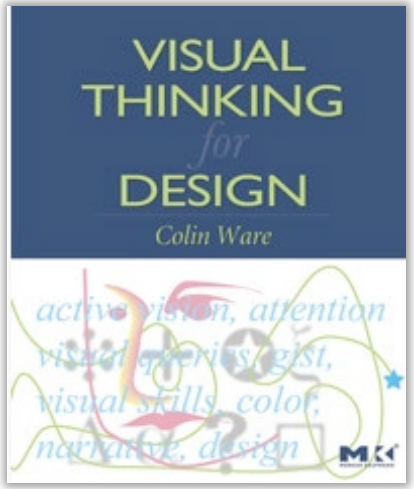
- Colin Ware (2004)



- Robert Spence (2006)

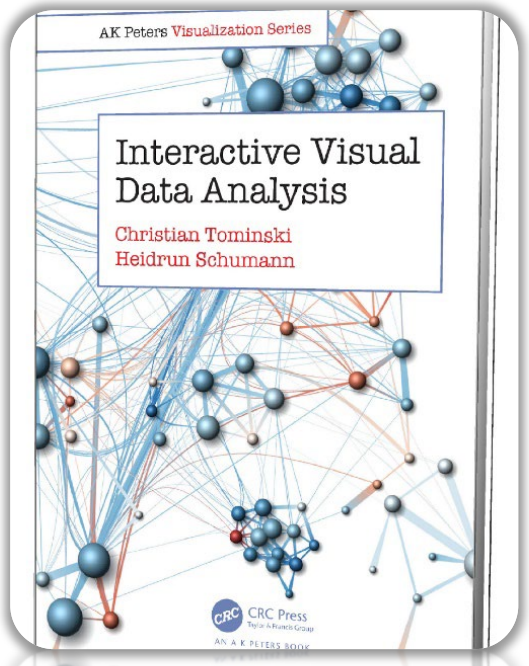


- Colin Ware (2008)

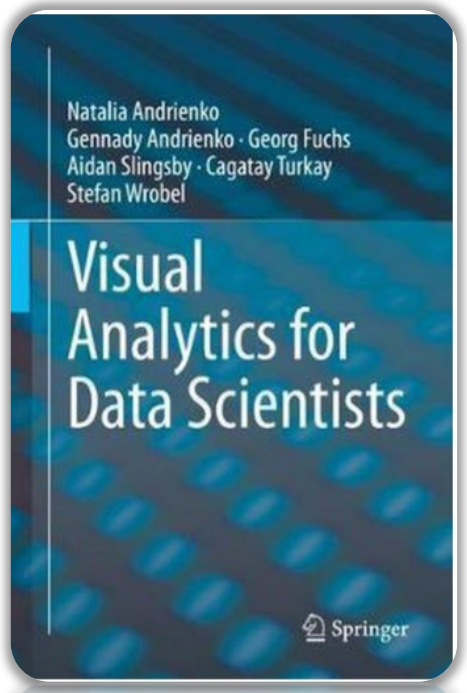


Other books

C. Tominski, H. Schuman (2020)



Andrienko et. al (2020)



Survey on Information visualization books
D. Rees , R. S. Laramee (2019)

Organization Instructions

- Work on group project during the instruction hours.
  - Wednesdays 13:30-15:15 (independent, no support)
  - Fridays 10:45-12:30 (support teachers + student assistants)

- Each week we provide assignments
  - Not graded, no need to hand in.
  - Guideline for interim and final project.

- (Additional) Group project feedback
  - From week 3 onwards
  - Subscribe, Wednesdays 15:30-17:30 (max. 12 groups) →
  - Prepare beforehand what you want to discuss, questions you have, etc.

Please subscribe yourself by filling in your group number. There are two spots available for each timeslot. Do not leave gaps between groups. Note that we will adapt the schedule if necessary to have consecutive meetings.

Date	Time	Group nr. 1	Group nr. 2
27-11-2024	15:30-15:50		
	15:50-16:10		
	16:10-16:30		
	16:30-16:50

Assignments and Groups

- Create groups of 4 people (through canvas – as soon as possible – *deadline Nov. 21*)

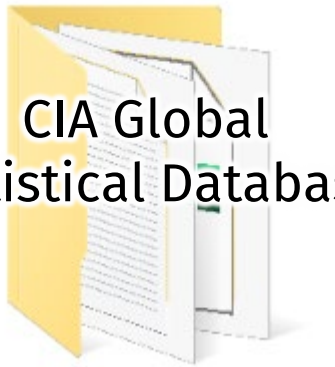
- Weekly assignments: serve as guided steps towards the final project.
  - You need to do more than the assignments for the final project but they guide you.
- Assignment 4 will be discussed in class (live lecture).

- The group work is meant that everybody in the group is involved in all aspects (i.e., design, justification, coding, and report) of the project and can defend them.

Project (see project description)

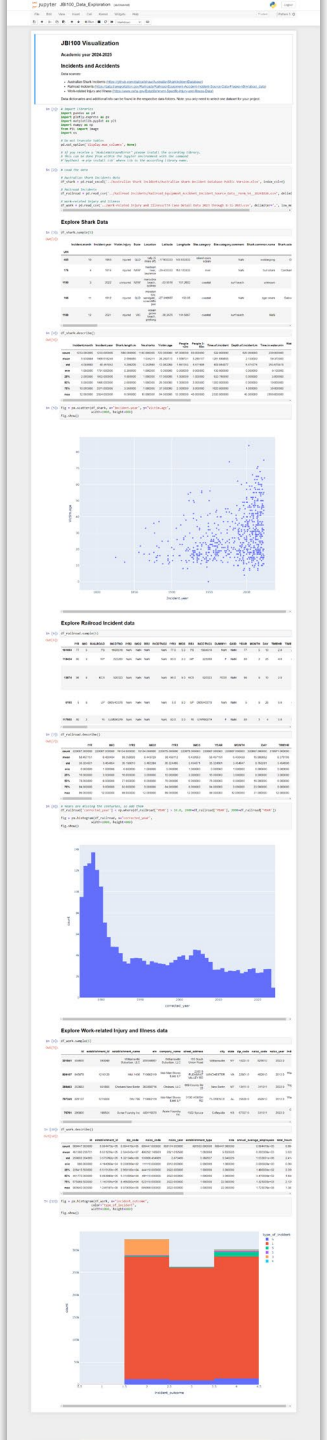
- Through the course you will design and implement a visualization tool for a specific data set
- Choice of two data sets (health & global statistics):

Hospital Beds Management



CIA Global Statistical Database

- Notebook with data loading and initial exploration provided →



Project (see project description)

- You will choose the platform in which you develop the visualization tool. Java, Python, JavaScript, C++, C#, whatever your project group finds suitable. Using libraries such as D3 or Dash is allowed.

- Using Jupyter notebooks for exploration/testing is Ok, for final solution is not allowed → difficult to customize and apply interaction techniques.

- Using Business Intelligence tools (Tableau, PowerBI, Qlik,…) is not allowed → hard/impossible to customize.

- We provide a basic framework as starting point in Python and Dash: https://gitlab.tue.nl/JBI100/dashframework

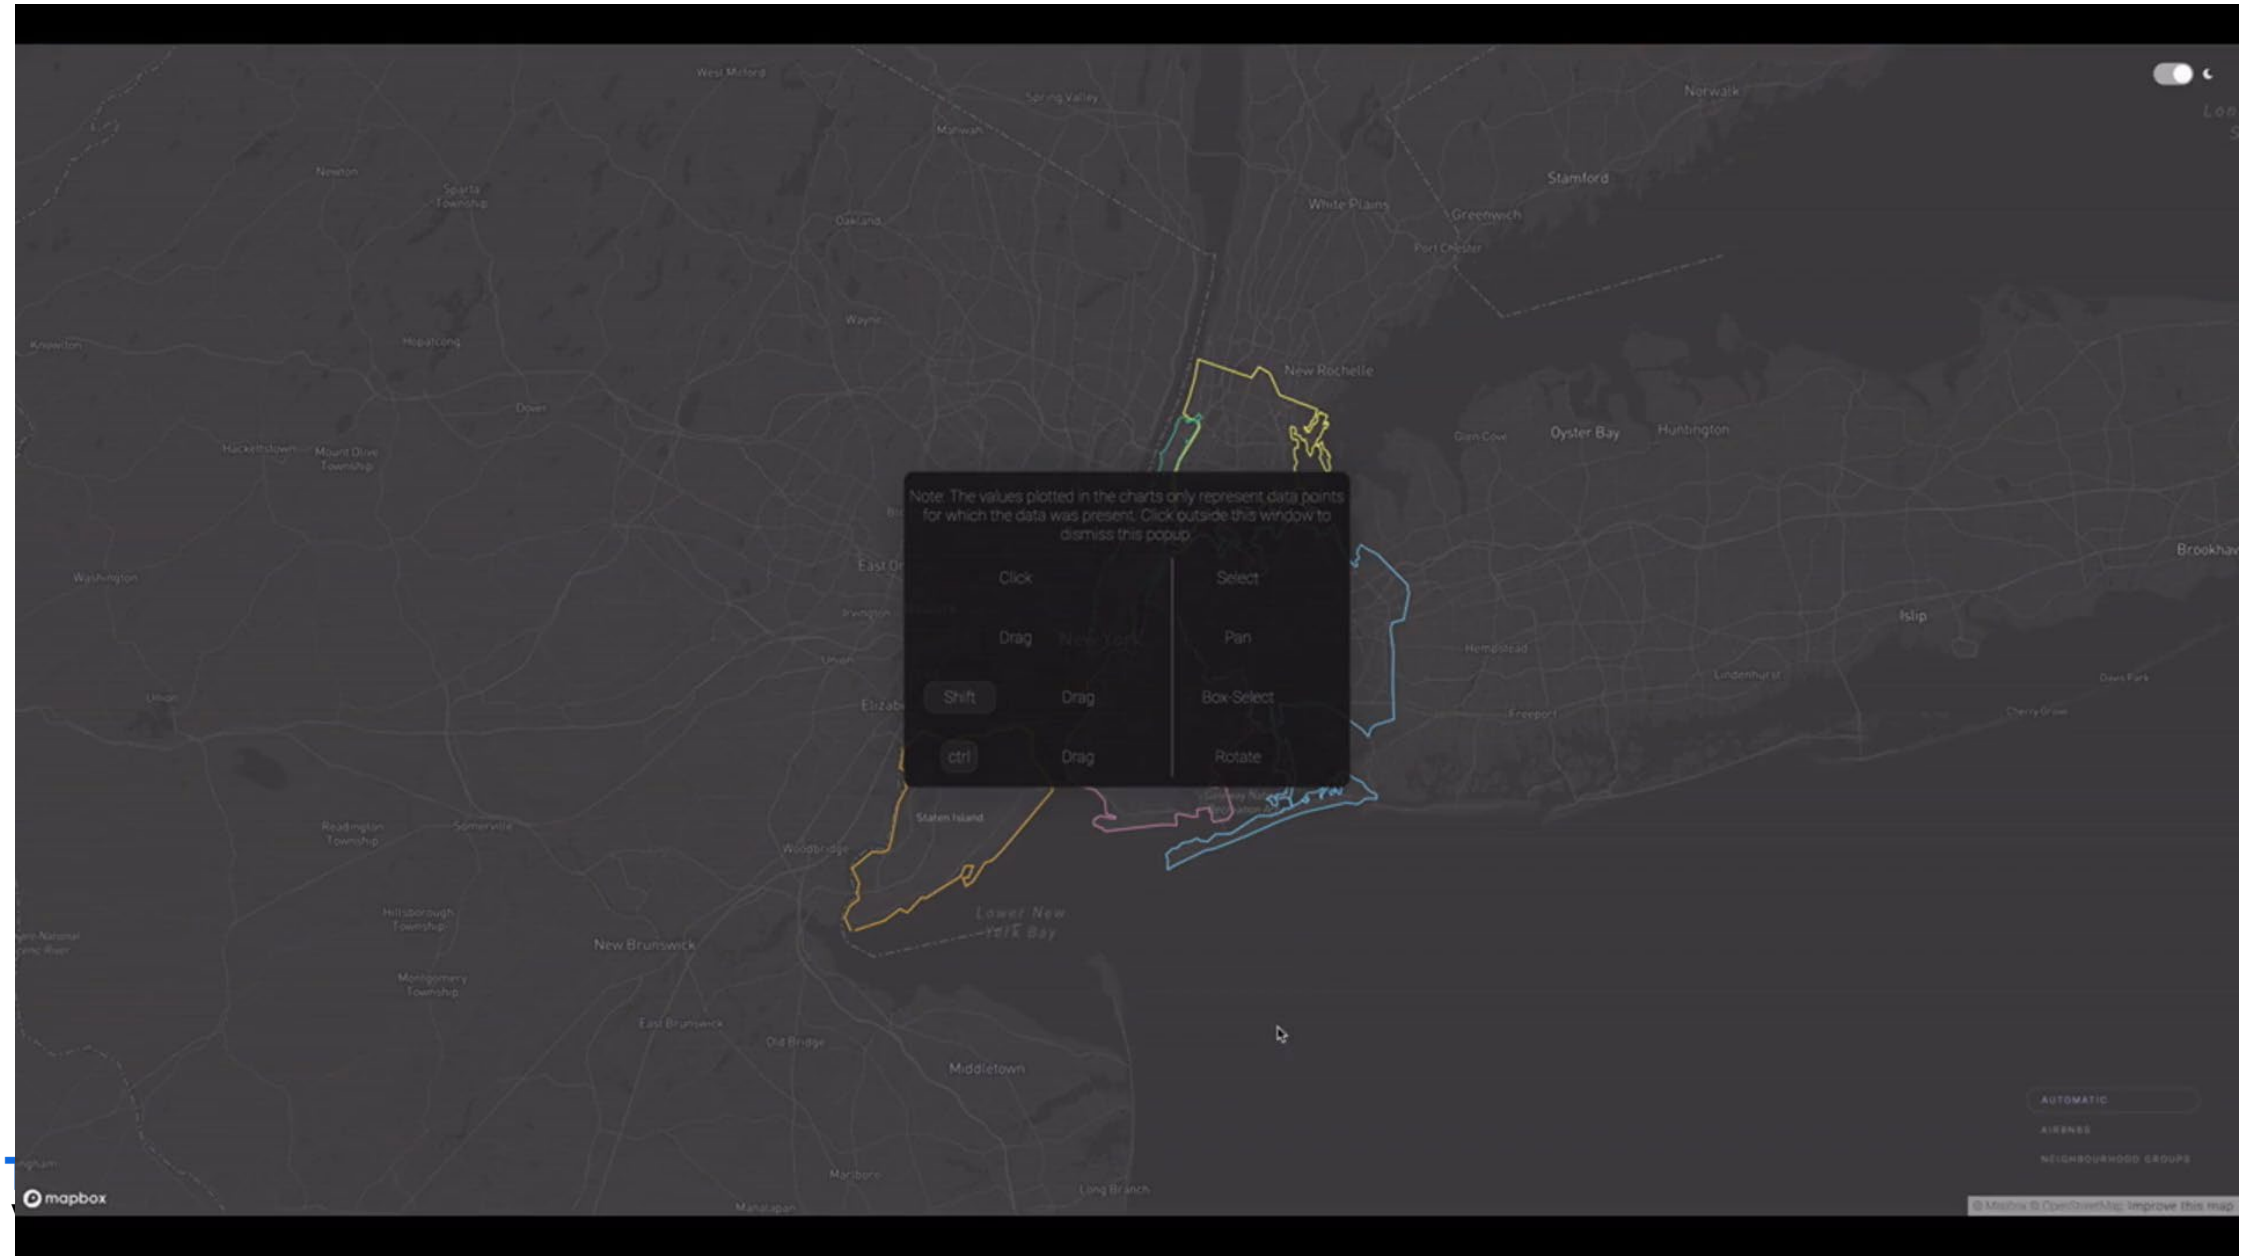
Project

- Report in two phases interim report and final report.

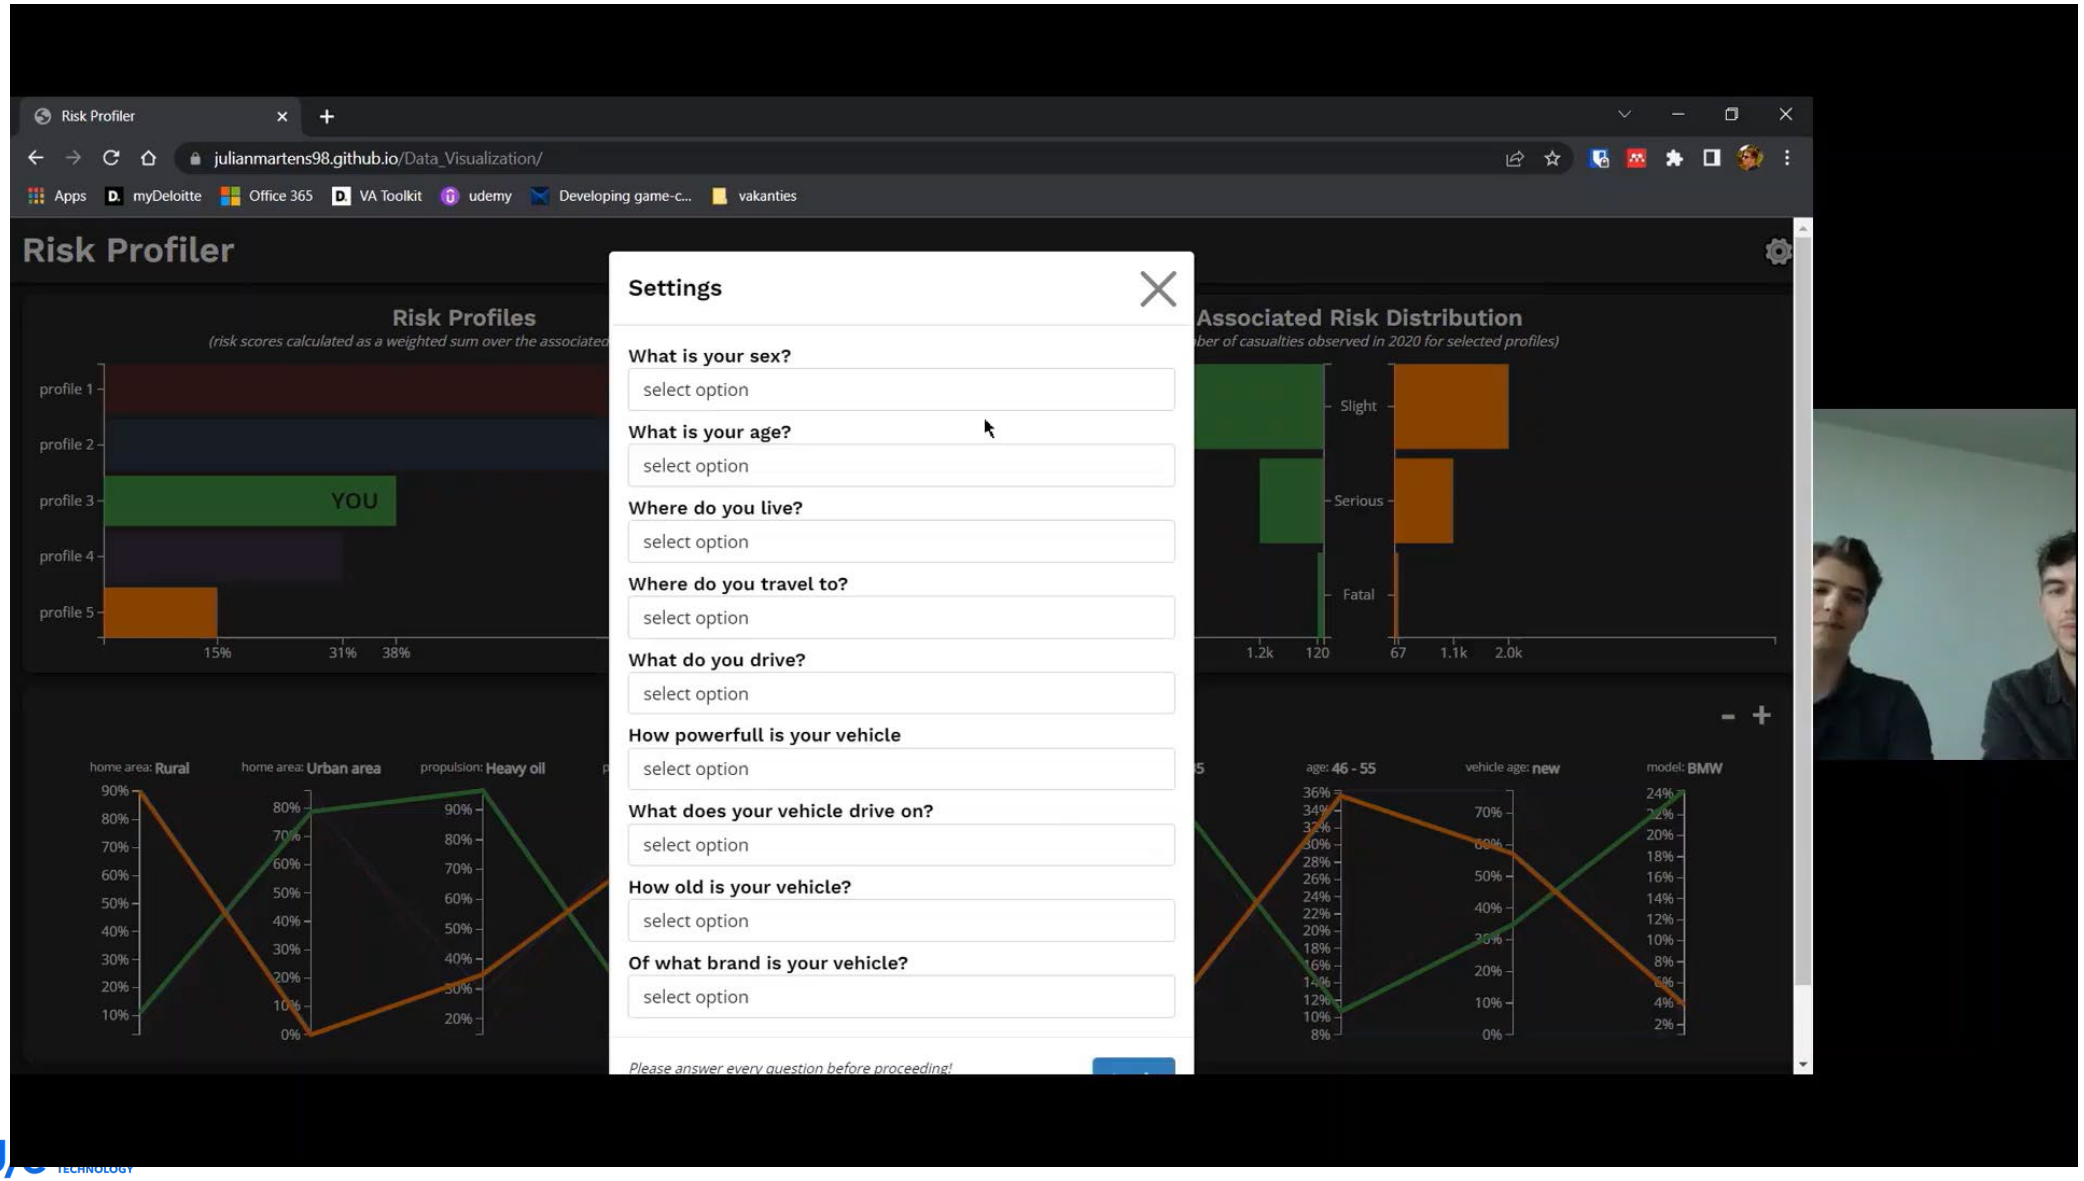
Deliverables (follow instructions of deliverables and look at rubric)

- Report interim/final in LaTeX (**overleaf**)
- Runnable software
- A video of length between 3 to 5 minutes
  - Illustrate what you did and why it is useful
  - Analyze the provided dataset with the tool and show what you have achieved
- Individual reports (division of work if not equal).

Example Result



Example Result



Important

- Deliverables will only be graded when they are handed in **BEFORE** the deadline.

- Deliverables that are incomplete or do not fulfill the format requested (e.g., style, number of pages, etc.) will not be evaluated.
  - *Important: show differences from interim to final project*
  - *Submitting interim as final project is not a valid submission*

- Project (source code, implementations) will only be graded when they are runnable.

- Prepare your **OWN** solution!

  If you take text or figures that you did not create yourself you have to mention the sources. Failing to do so is considered **plagiarism**.

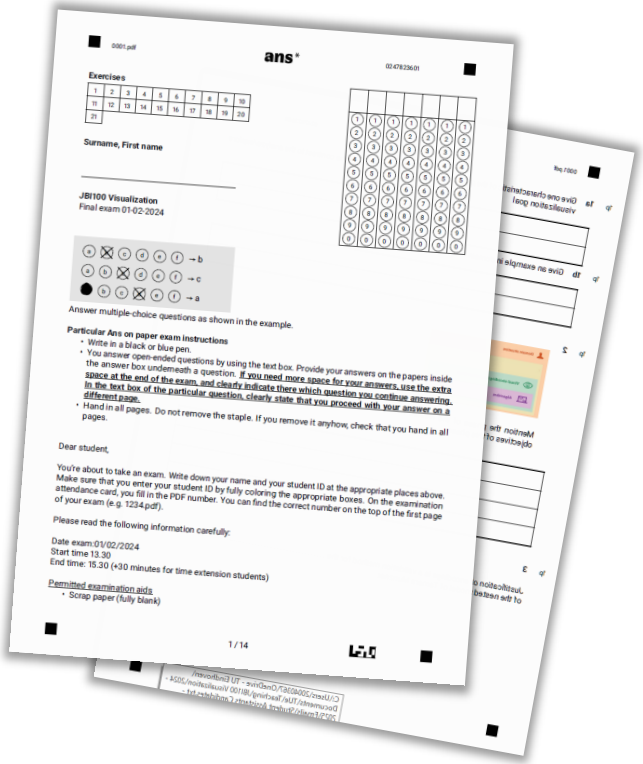
Exam

Exam in week 10: January 29th (13:30-15:30)

- Individual evaluation of the objectives.

- The exam will be multiple choice and short answer questions based on what is presented in the lectures. Questions are *similar* to Quiz questions.

- It includes applying the theory learned in class
- All material given during class is part of the exam



ans*

Exercises

Surname, First name

JBI100 Visualization
Final exam 01-02-2024

Answer multiple-choice questions as shown in the example.

Particular Ans on paper exam instructions

- Write in a black or blue pen.
- You answer open-ended questions by using the text box. Provide your answers on the papers inside the answer box underneath a question. **If you need more space for your answers, use the extra space at the end of the exam, and clearly indicate there which question you continue answering. In the text box of the particular question, clearly state that you proceed with your answer on a different page.**
- Hand in all pages. Do not remove the staple. If you remove it anyhow, check that you hand in all pages.

Dear student,

You're about to take an exam. Write down your name and your student ID at the appropriate places above. Make sure that you enter your student ID by fully coloring the appropriate boxes. On the examination attendance card, you fill in the PDF number. You can find the correct number on the top of the first page of your exam (e.g. 1234.pdf).

Please read the following information carefully:

Date exam:01/02/2024
Start time 13.30
End time: 15.30 (+30 minutes for time extension students)

Permitted examination aids
- Scrap paper (fully blank)

1 / 14

Grading

- 30% Exam – individual (January 29th)
- 70% Project – in groups, interim report (15%) + final (85%)

The final grade is computed as

Final grade = 0.3 Exam + 0.7 Project

- Exam needs to be 5.0 or higher
- Pass the course if final grade ≥ 5.5

Resit

- Resit possibility for Exam on April …th time/location tbd
  - Highest mark is considered

- The mark of the project, if it is above 5.5 will be kept for one year. Meaning that next year you only have to do the exam.

- The project can not be resit.

Contact

- Instruction hours on Fridays
- Subscribed feedback sessions
- Canvas discussion channels (monitored by SAs)
  - [Theory and Organizational] JBI100 Questions
  - [Project and Assignment] JBI100 Questions

e-mail is reserved just for **specific personal questions**. I do not ensure that general content questions will be answered by e-mail.

Time involvement

- The course is 5 ECTS = 140 hours (2x28).
- On average you need to spend 14 hours a week.

Do not postpone working on the project.

Prerequisites

Knowledge in programming

- Any programming language is suitable like Java, C++, C#, Python, or JavaScript

- Elementary programming principles like variables, assignment, composition, selection, repetition, procedures/functions, arrays, and how to use these to construct simple programs should be there.

No previous visualization knowledge is assumed.

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

JADS Jheronimus Academy of Data Science

Goals of the Visualization Course

After completion of the course students:

- have **knowledge** and **understanding** of the basic **principles** in **Visualization** and **Interaction**, Visualization **design process**, and **evaluation**.
- are able to **apply** these principles to effectively design visualizations.
- are able to effectively **communicate** the (interim) results both **orally** and in **writing**.

What is this course NOT about

- Learn how to implement random charts on a web environment
- Learn how to build complex software
- Learn how to build a very complex static visualization (interaction is essential)
- Learn how to make parsers for data cleaning, or pre/post-processing…

…

What is (Data) **Visualization**?

Visualization

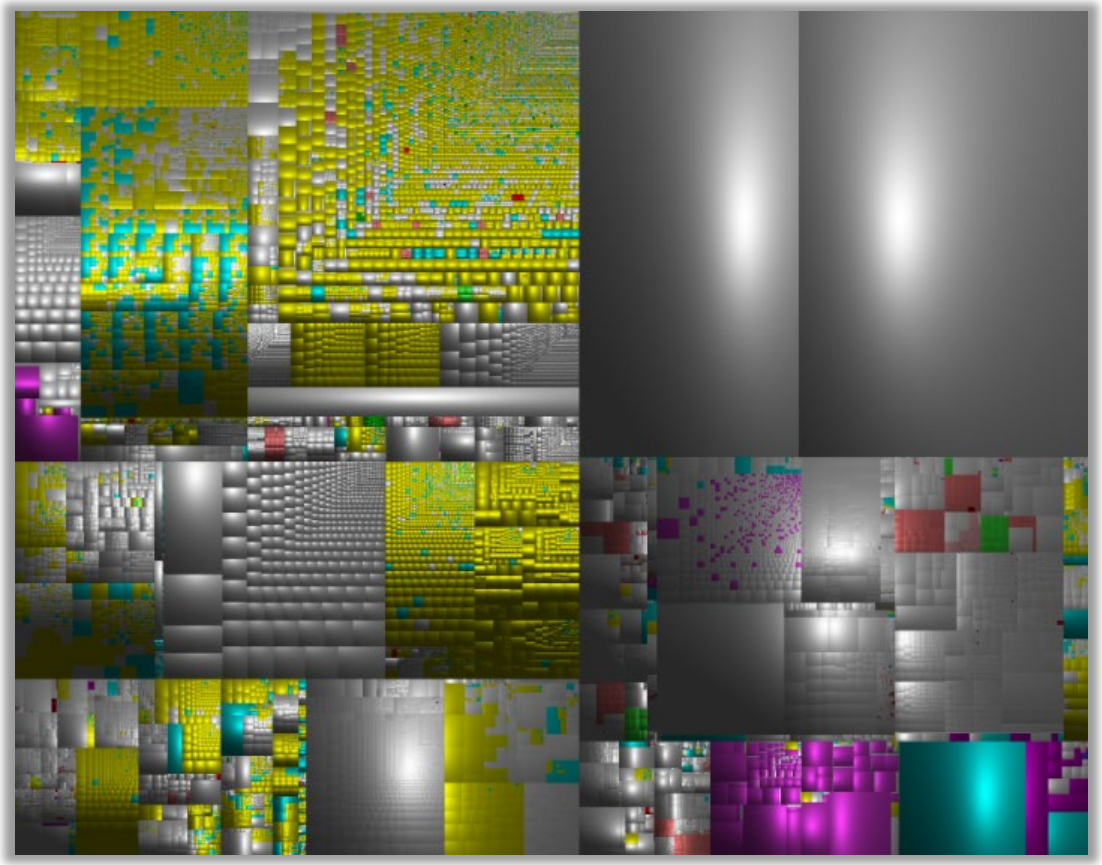
Visualization is typically used for data exploration and making the unseen visible.



SequoiaView; van Wijk et al., InfoVis 1999

Visualization

Visualization is typically used for data exploration and making the unseen visible.

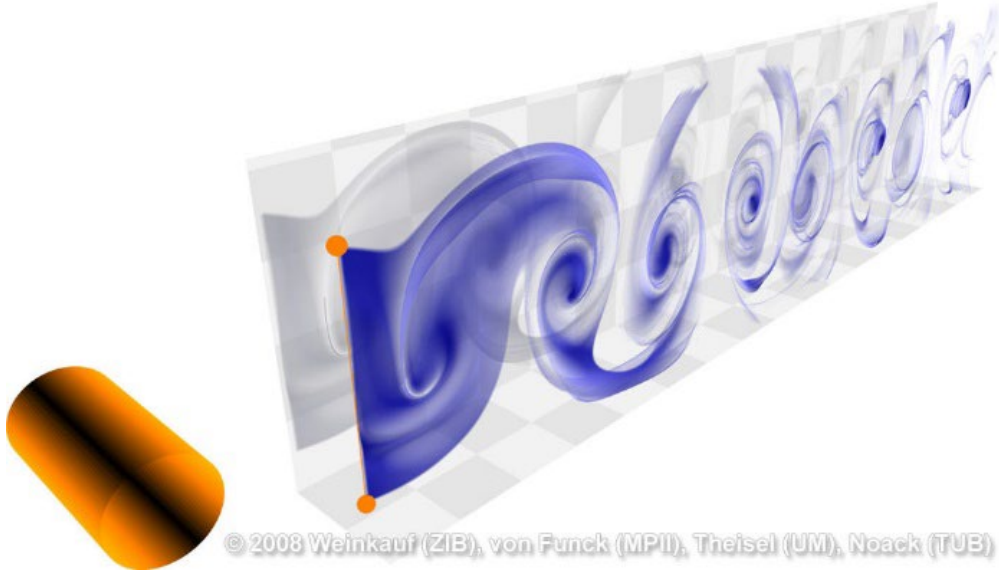
- Based on human visual perception.
- Exploit pattern recognition capabilities of the human visual system.
- Eyes act as a very high-bandwidth channel to the brain, large portion dedicated to visual processing.
- Processing occurs in parallel at the preconscious level.

Visualization

Visualization is often an intuitive step: graphical illustration

Visualization as such is rather old…

L. Da Vinci (1457-1519)



Weinkauf et al. 2008

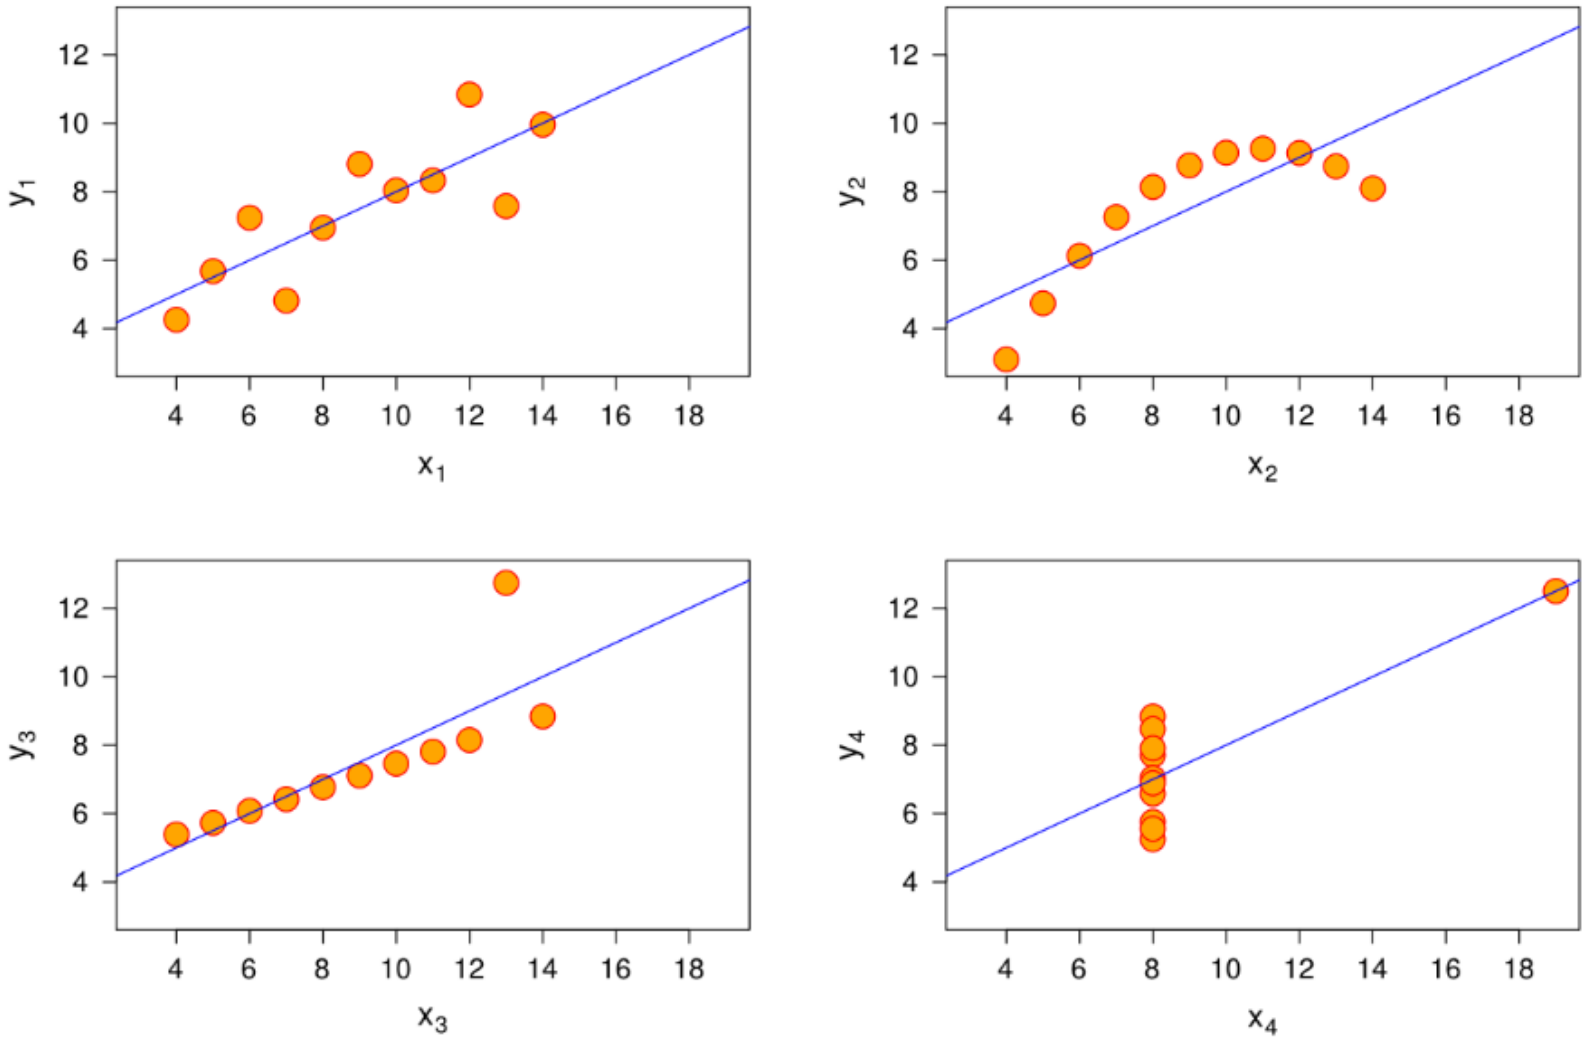
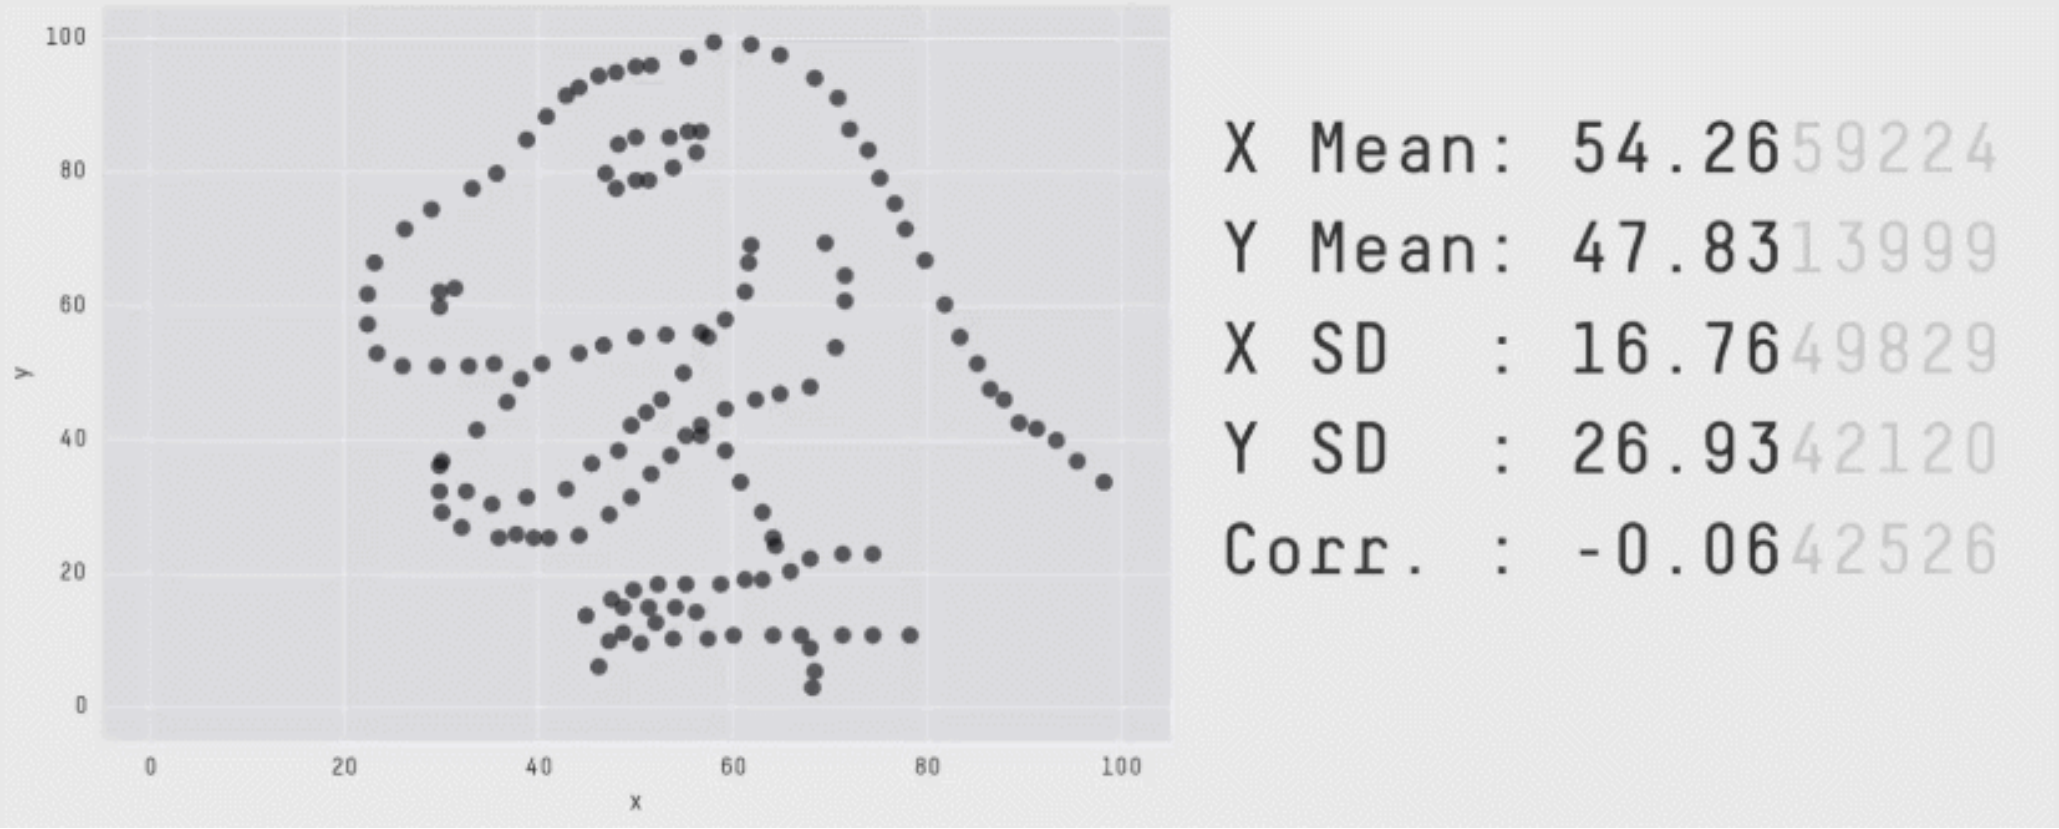
Anscombe's Quartet

Numbers do not tell the whole story



Anscombe's Quartet
http://upload.wikimedia.org/wikipedia/commons/b/b6/Anscombe.svg

Numbers do not tell the whole story



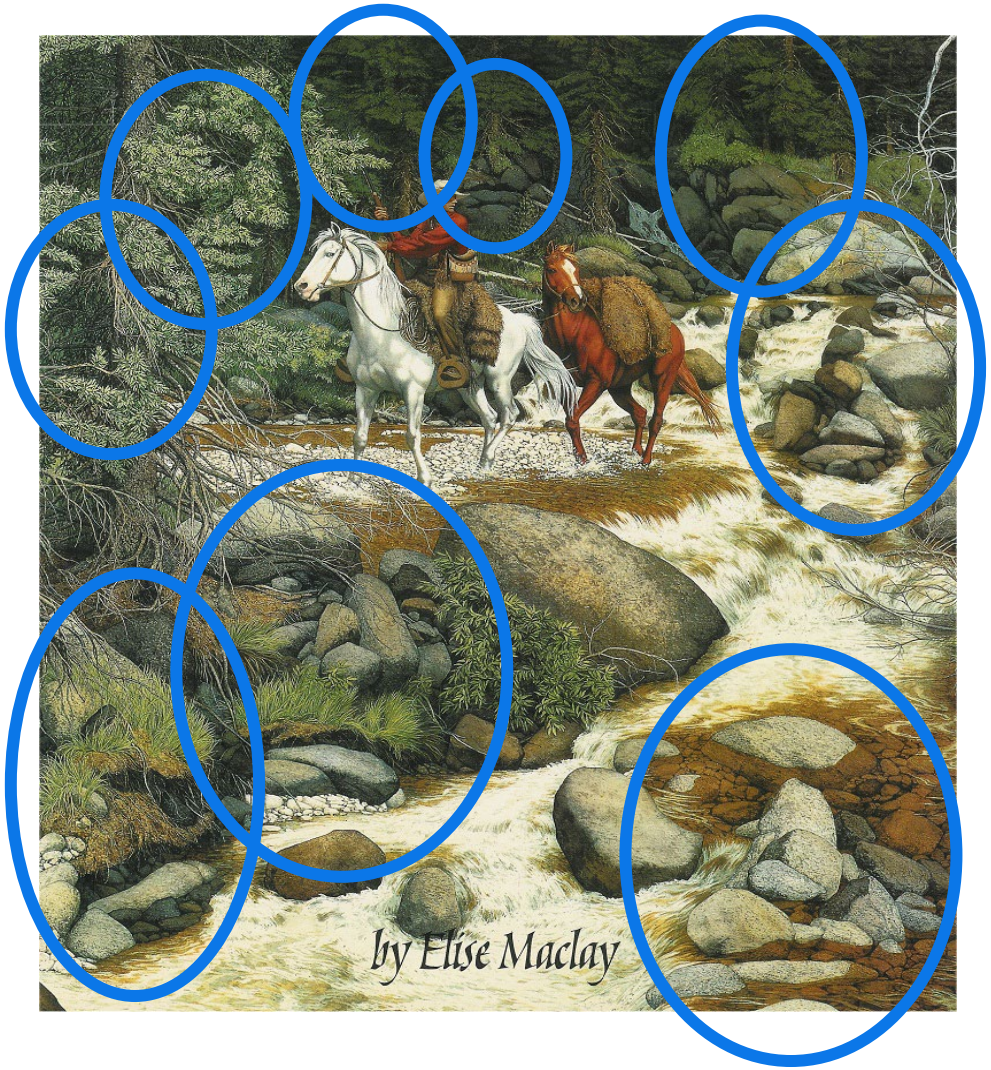
http://blog.revolutionanalytics.com/2017/05/the-datasaurus-dozen.html

Why visualization

- ±90% of information about the environment is received through the eyes.
- ± 50% of our brain neurons are involved in the processing of visual information.
- The presence of pictures increases desire to read the text by ± 80%.
- We remember 10% of what we heard, 20% of what's read, and 80% of what's seen!

McLeod, S. A. (2018). Visual perception theory. Simply Psychology.
www.simplypsychology.org/perception-theories.html

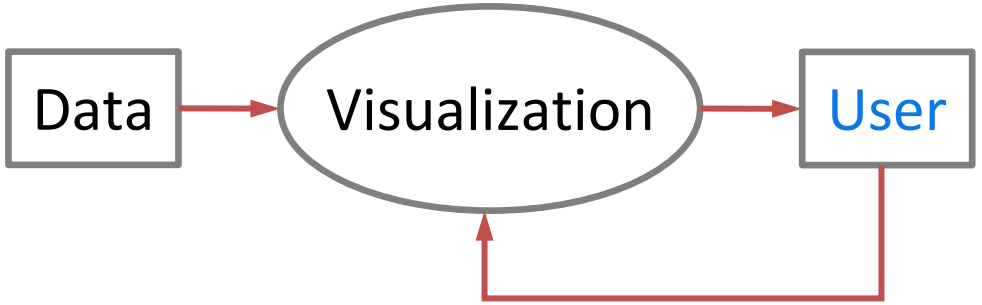
We are good at pattern recognition



Bev Doolittle: The forest has eyes

Information Visualization

The use of computer-supported, ***interactive***, **visual** representations of ***abstract*** *data* to **amplify cognition** (*Card et al., 1999*)



Why human in the loop?

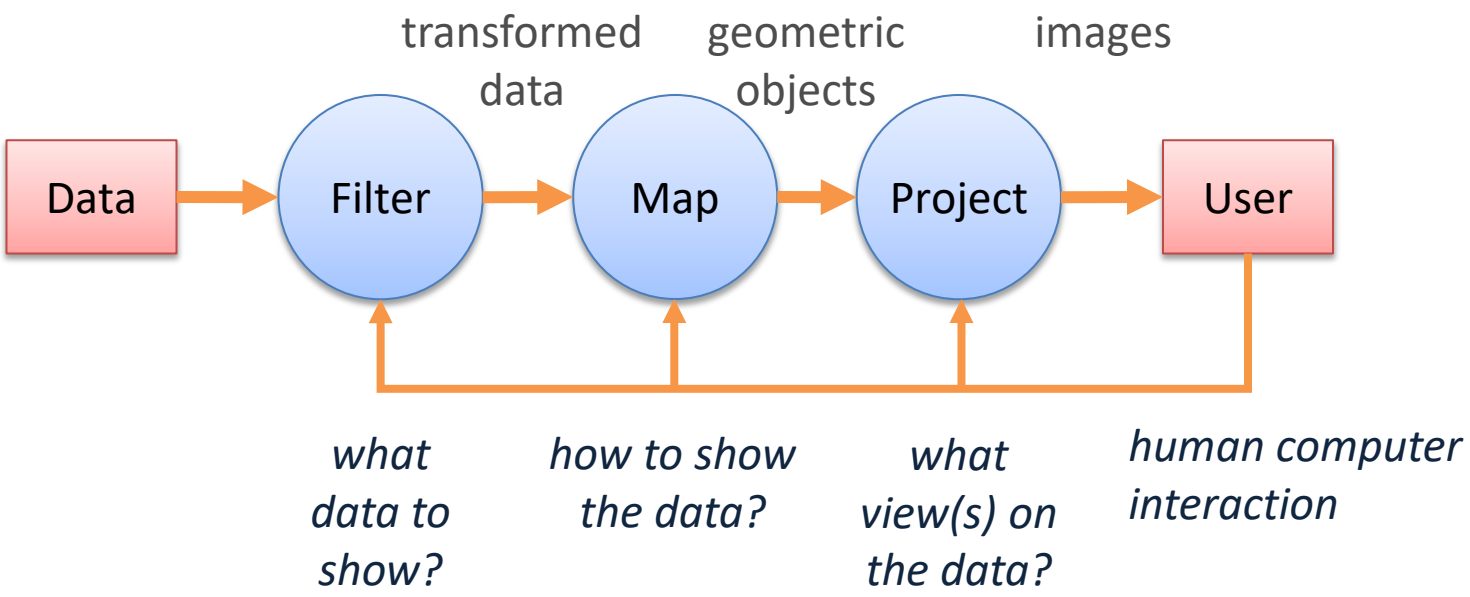
Computer-based visualization systems provide **visual representations** of **datasets** and **interactions** designed to help **people** carry out **tasks** more **effectively**

- For well-defined questions, computational techniques from statistics and machine learning often suffice.

- However, many analysis problems ill-specified
  unclear what questions to ask upfront or how to answer them

- Use visualization to augment human capabilities

Visualization pipeline



Data Visualization

Visualizations – Three Types of Goals

Visualization, …

- … to explore

  Nothing is known,
  Vis. used for data Exploration

- … to analyze

  There are hypotheses,
  Vis. used Verification or Falsification

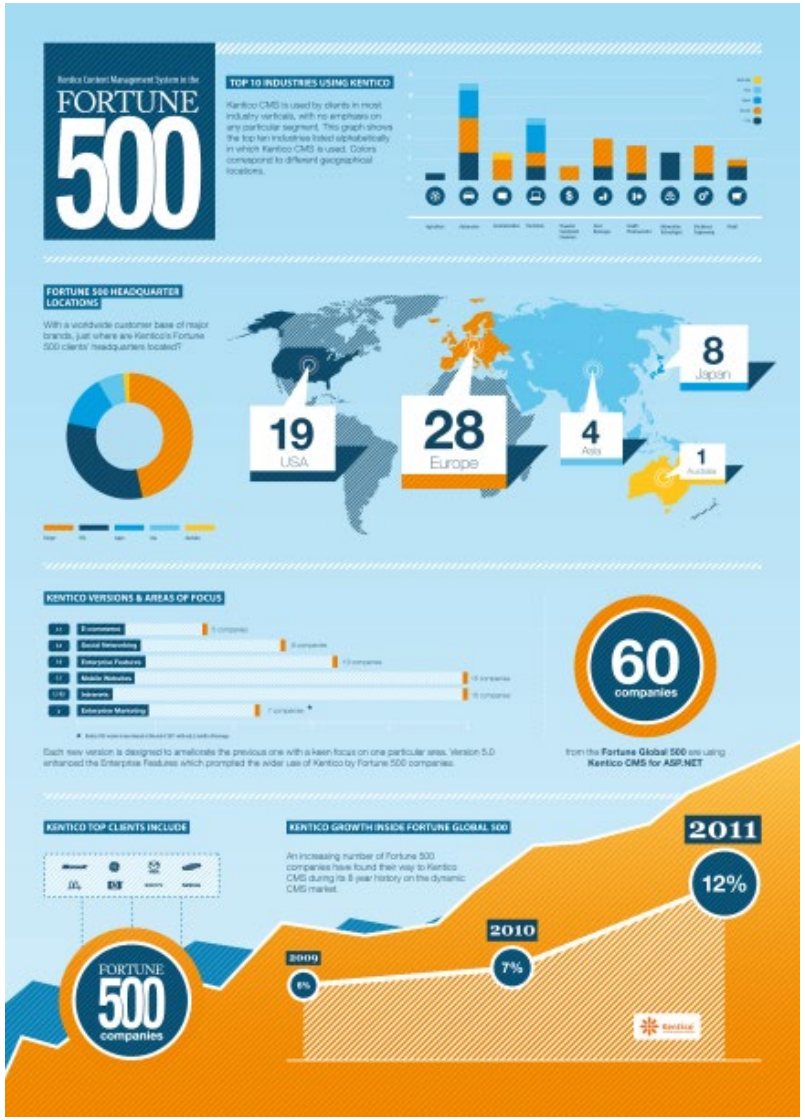
- … to present

  “everything” known about the data,
  Vis. used for Communication of results

Example Presentation

Infographics:

- Static (often)
- Explanation
- Made by data journalist
- Viewed by lay audience



Kentico.com

Presentation vs Exploration

Infographics:

- Static vs interactive
- Explanation vs explorative
- Made by data journalist vs domain expert
- Viewed by lay audience vs domain expert

What should I do?

- Read canvas and the provided assignments and project description. Get familiar with where the information is.
- Create your group (*deadline Nov. 21*)
- Look at assignment 1 (follow instructions)
- Start working on the assignments with the group
- Read literature related to todays session in canvas/schedule

Good luck and have fun!

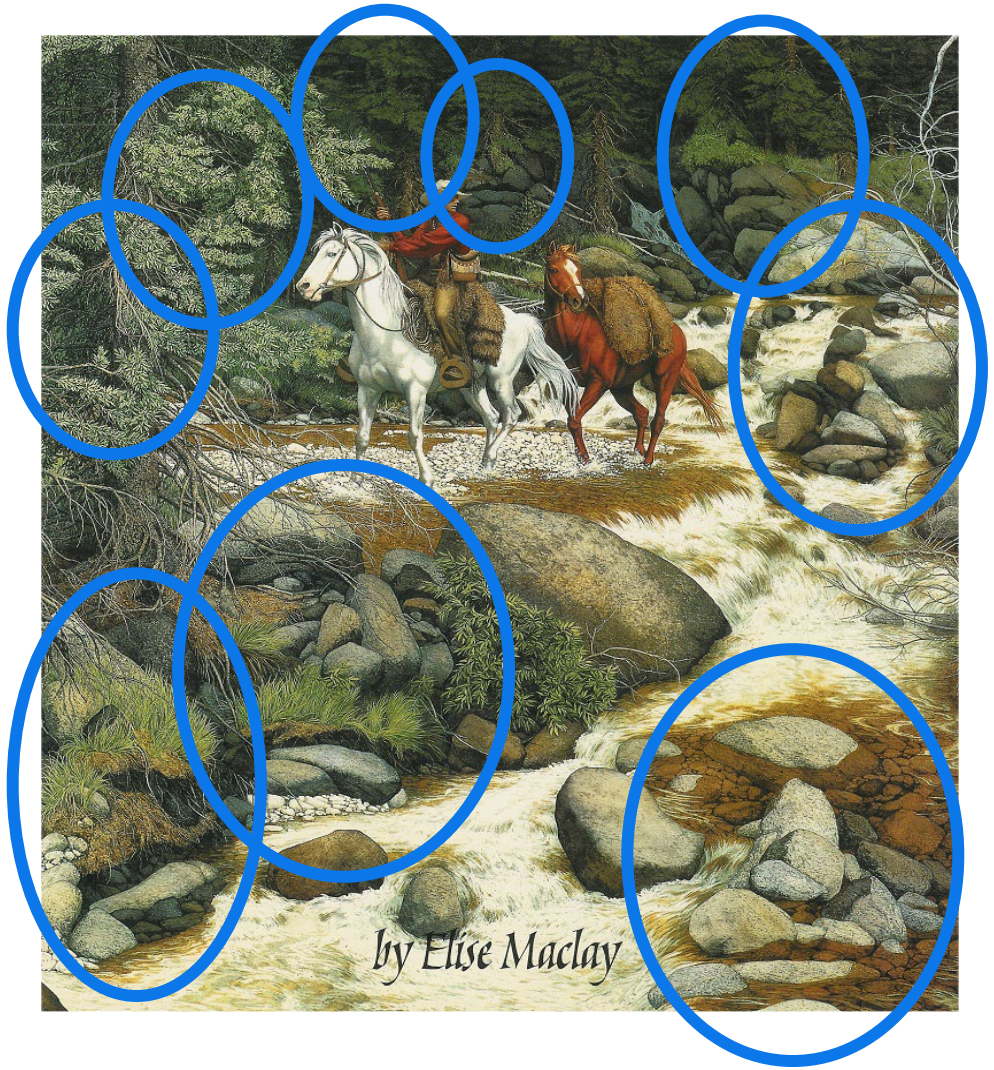
Why visualization

- ±90% of information about the environment is received through the eyes.
- ± 50% of our brain neurons are involved in the processing of visual information.
- The presence of pictures increases desire to read the text by ± 80%.
- We remember 10% of what we heard, 20% of what's read, and 80% of what's seen!

McLeod, S. A. (2018). Visual perception theory. Simply Psychology.
www.simplypsychology.org/perception-theories.html

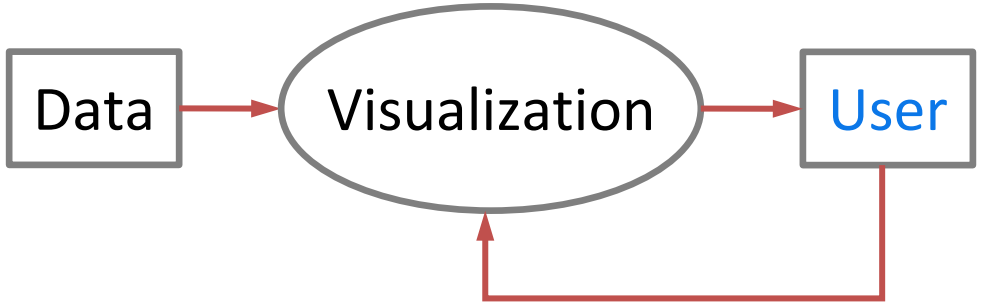
We are good at pattern recognition



Bev Doolittle: The forest has eyes

Information Visualization

The use of computer-supported, ***interactive***, **visual** representations of ***abstract*** *data* to **amplify cognition** (*Card et al., 1999*)

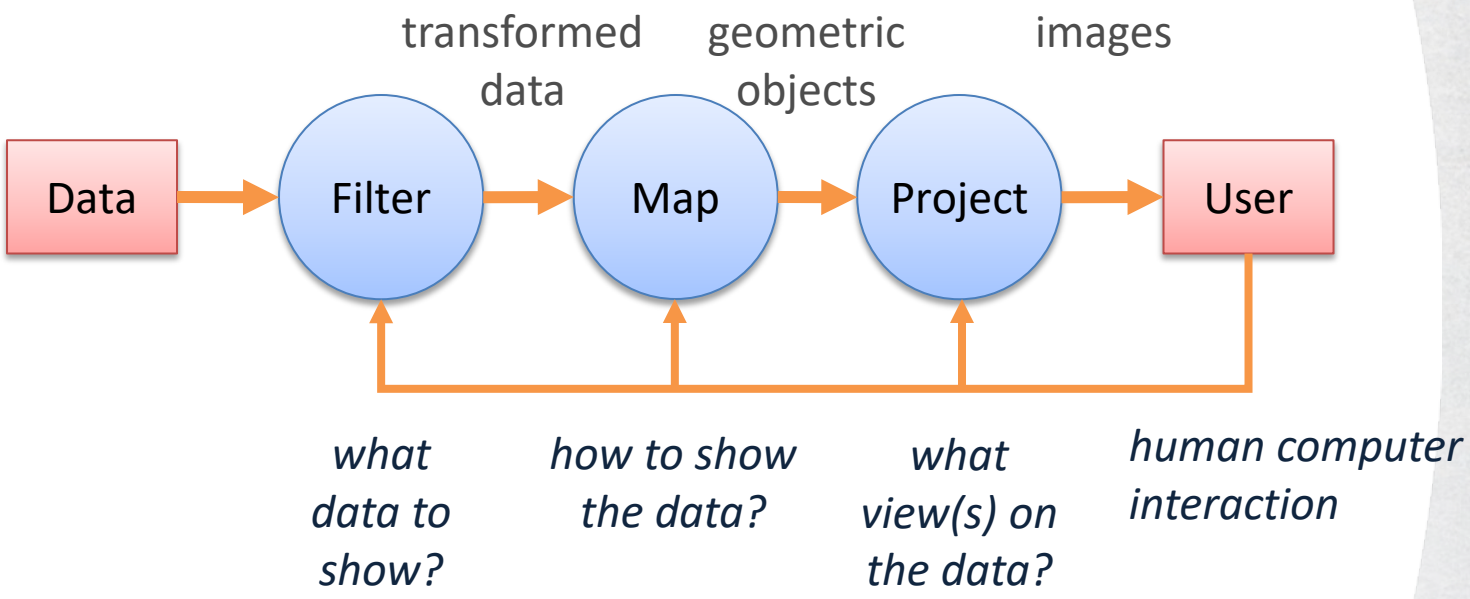


Why human in the loop?

Computer-based visualization systems provide **visual representations** of **datasets** and **interactions** designed to help **people** carry out **tasks** more **effectively**

- For well-defined questions, computational techniques from statistics and machine learning often suffice.
- However, many analysis problems ill-specified
  unclear what questions to ask upfront or how to answer them
- Use visualization to augment human capabilities

Visualization pipeline



Data Visualization

~~Making pretty pictures~~

Visualizations – Three Types of Goals

Visualization, …

- … to explore

  Nothing is known,
  Vis. used for data Exploration

- … to analyze

  There are hypotheses,
  Vis. used Verification or Falsification

- … to present

  “everything” known about the data,
  Vis. used for Communication of results

Goals of the Visualization Course

After completion of the course students:

- have **knowledge** and **understanding** of the basic **principles** in **Visualization** and **Interaction**, Visualization **design process**, and **evaluation.**
- are able to **apply** these principles to effectively design visualizations.
- are able to effectively **communicate** the (interim) results both **orally** and in **writing**.

Worth looking at

- John Stasko Capstone EuroVis 2014 - http://vimeo.com/98986594
- Hans Rosling – GapMinder

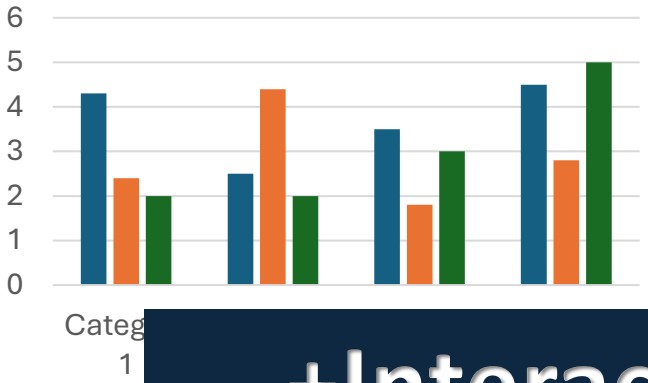
TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

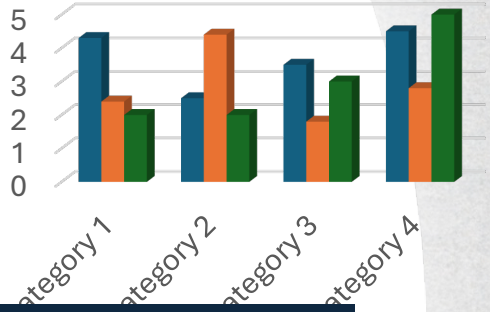
Visualization

Visualization Design

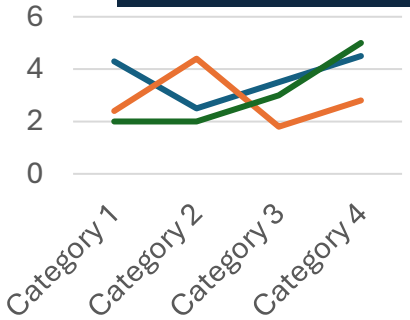
Prof. dr. Anna Vilanova

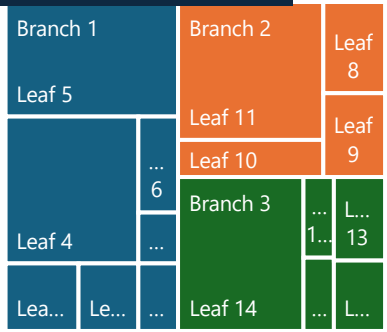
Design space is huge





+Interaction !





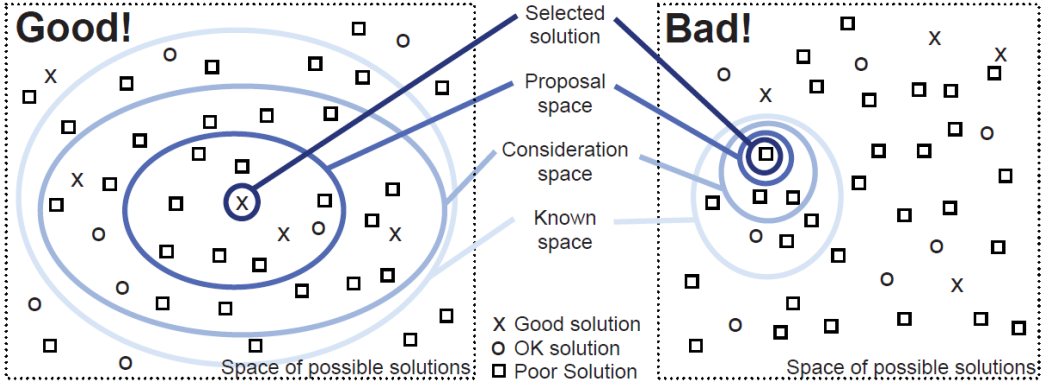
Visualization Design

- Huge space of design alternatives
  - Trade-offs abound

Visualization Design

- Huge space of design alternatives
  - Tradeoffs abound
- Many possibilities known to be ineffective
  - avoid random walk through the possibilities
  - avoid some of known mistakes
  - extensive experimentation
- Guidelines continue to evolve
  - Iterative refinement usually wise

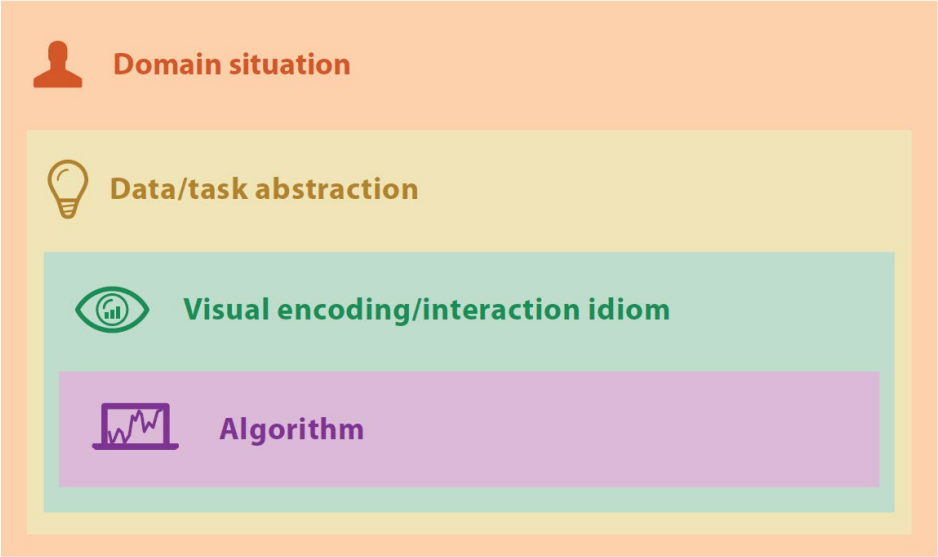
Visualization Design Process



Validation is difficult

- How do you know if the visual design works?
  - better? faster?
  - more effective?
  - get more insight?
- What sort of tasks do you need to evaluate?
- Who are the intended users?
- Which data are we using (benchmark data)?

Visualization Design Process



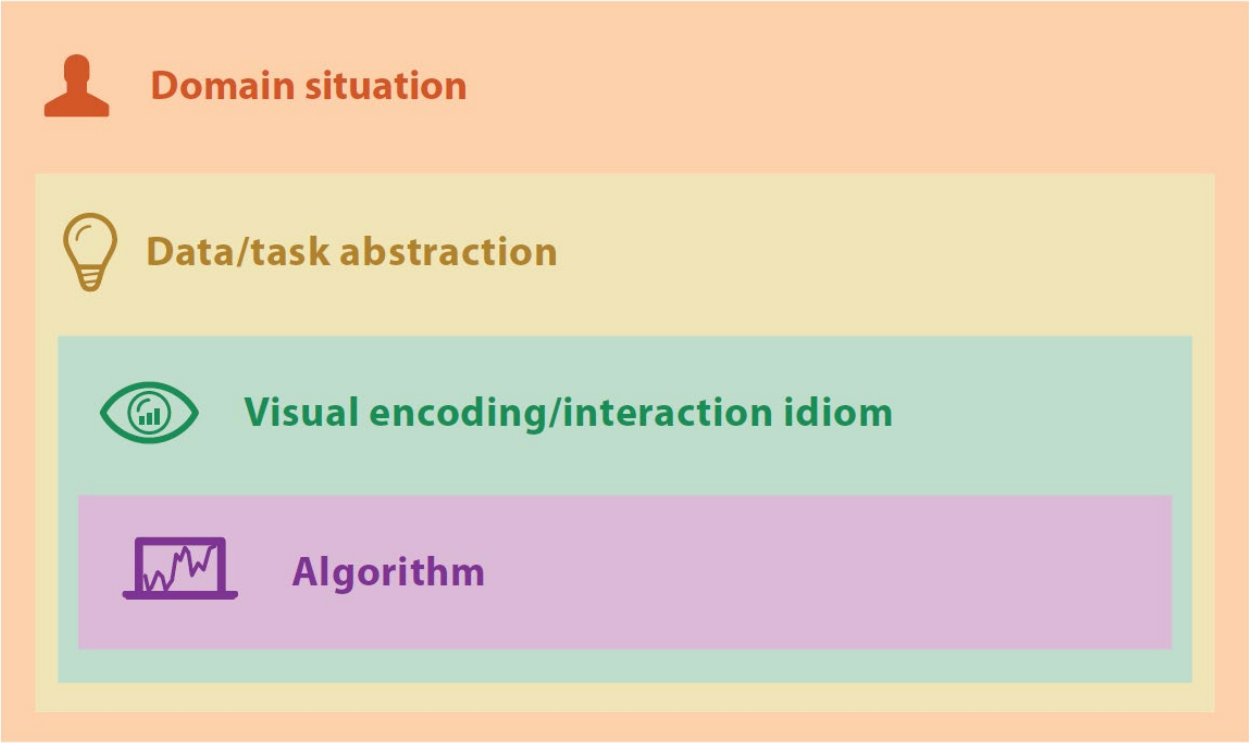
TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

Nested Model

Prof. Anna Vilanova

Nested model

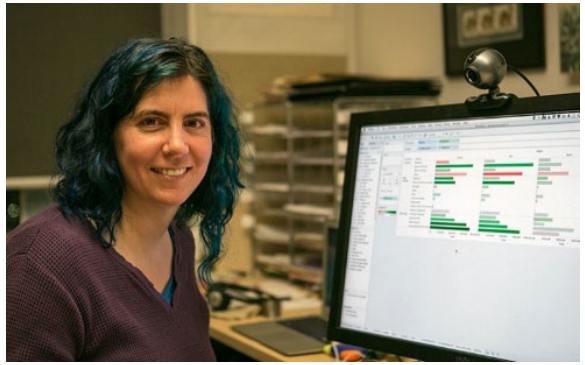


Lectures: Tamara Munzner’s book

Visualization analysis & design

by Tamara Munzner,

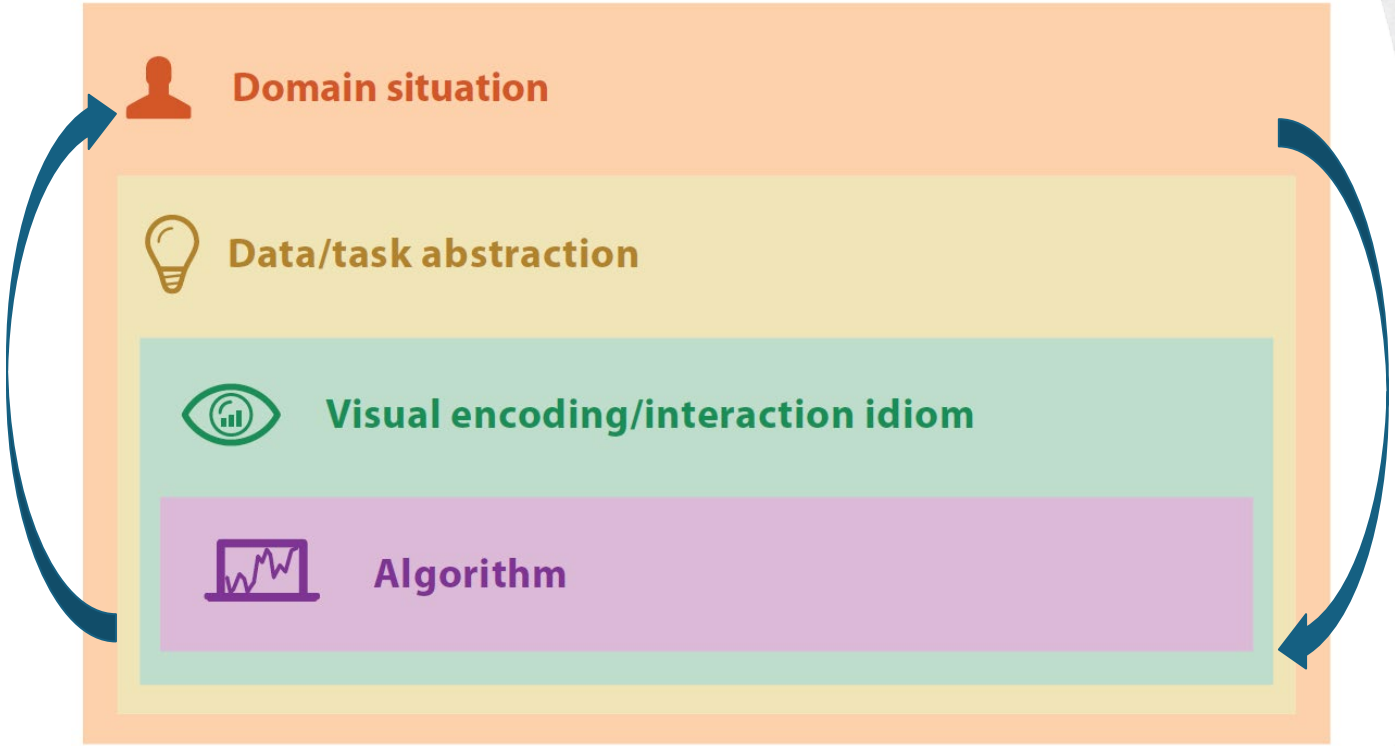
ISBN: 9781466508934



You can find the book at the library:
https://tue.on.worldcat.org/oclc/897069361

Visualization Design (Nested model)

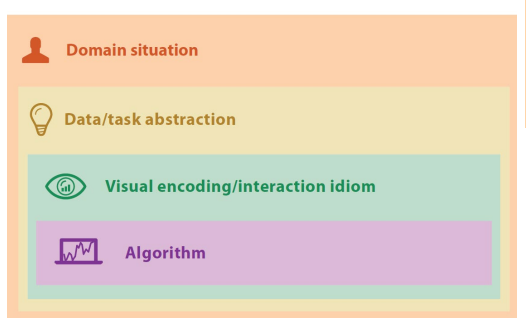
Iterative/refinement process



Nested model (domain)

domain situation - problem characterization

- Understand the user, the data and tasks



Know your users

- What are their needs/wants/limitations/skills?
- What is their workflow?

- How to provide actionable knowledge?
  - What decisions must be made?
  - What information is relevant for that?

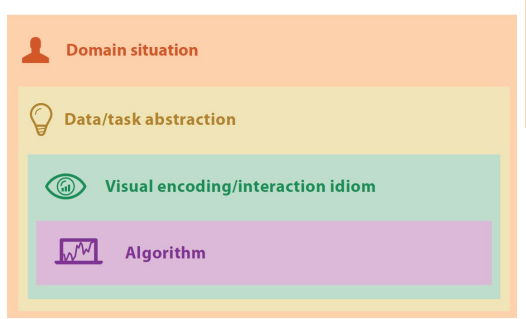
- How to make them happy/enthusiastic/satisfied?

Nested model

domain situation - problem characterization

- Understand the user, the data and tasks
- Use domain specific vocabulary
- Produce a set of tasks/questions of target users on the data, on different levels

- Information obtained through interviews, observation, reading, …
- Understand the user, the data and tasks

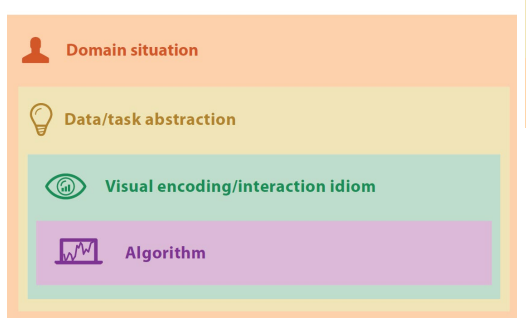


Nested model

domain situation - problem characterization

data/task abstraction design

- Data described in generic (Visualization) terms:
  table, hierarchy, sets, …
- Tasks described in generic (Visualization) terms:
  search, compare, see trend, …

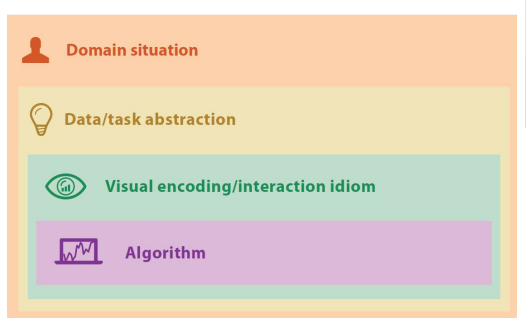


Nested model

domain situation - problem characterization

data/task abstraction design

- Data described in generic (Visualization) terms:
  table, hierarchy, sets, …
- Tasks described in generic (Visualization) terms:
  search, compare, see trend, …



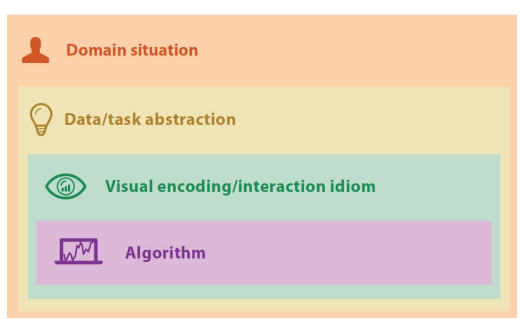
Nested model

domain situation - problem characterization

data/task abstraction design

visual encoding/interaction idiom

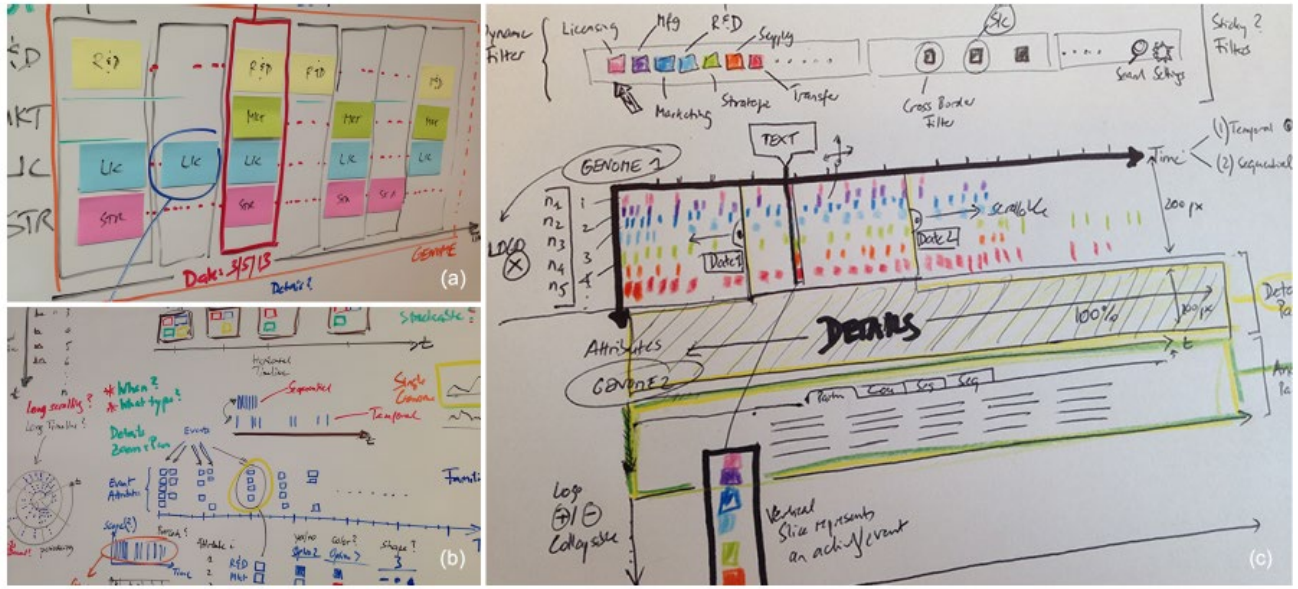
Design space, select visual encodings, define interactions, etc.

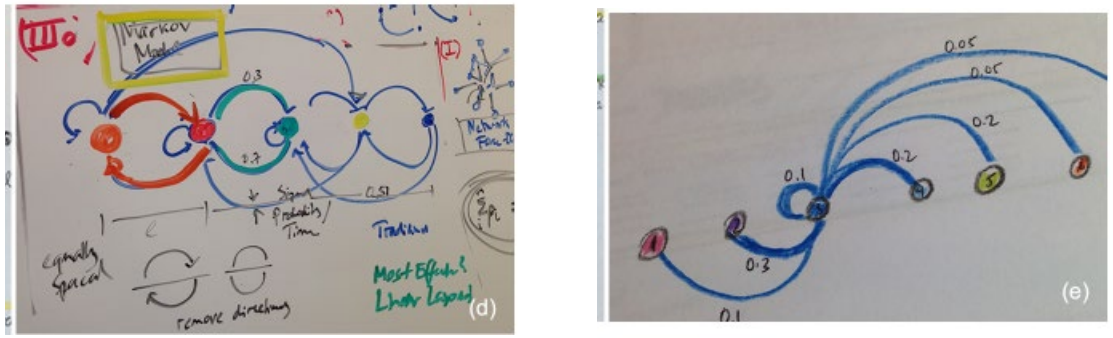


Generating solutions

- Creative approach
- Exploring design space

Visualization/interaction design





Basole et al., Understanding Alliance Portfolios using Visual Analytics, 2017.

Sketching!

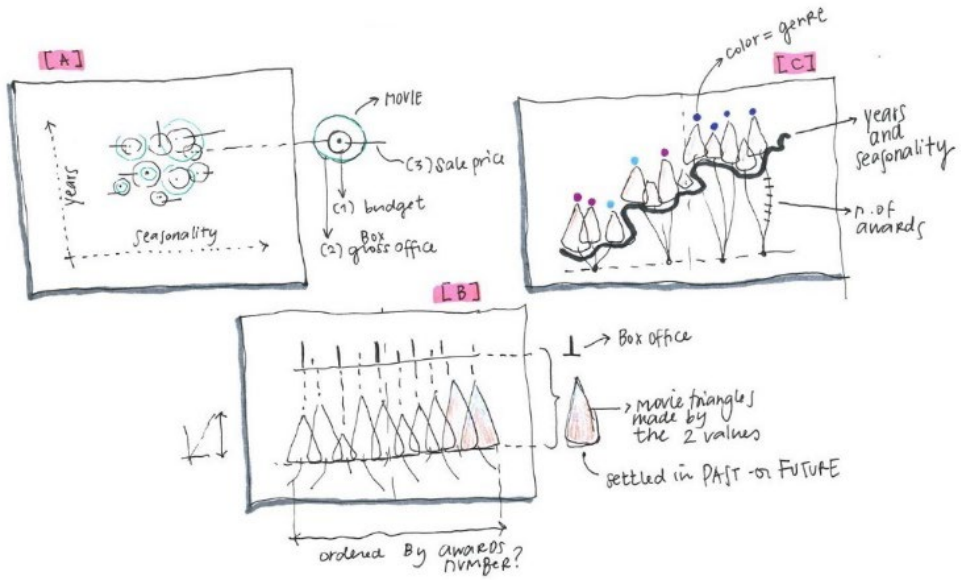
- Sketching: fast, imprecise, conceptual
- Computer tools: slow, precise, final

- Use pens and paper:
  - different line widths, different colors
- Don’t erase, overdraw, emphasize important lines

- Many sources on how to sketch
  https://www.slideshare.net/jacksonfox/sketching-for-design

Sketching!

- Explore design space
- Find solutions
- Find structure
- Find and break constraints
- Inspire yourself



https://medium.com/accurat-studio/sketching-with-data-opens-the-mind-s-eye-92d78554565

Generating solutions

- Creative approach
- Exploring design space!
- **Engineering, systematic approach**

Nested model

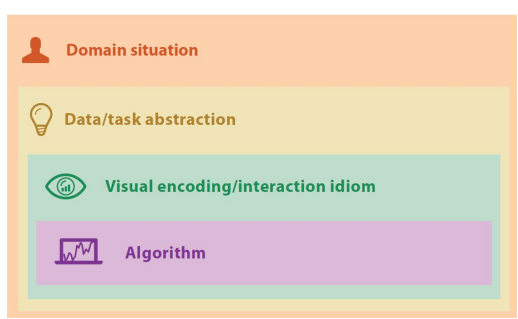
domain situation - problem characterization

data/task abstraction design

visual encoding/interaction idiom

algorithm

layout algorithm, ordering, rendering …



Dangers at each level

A mistake at the higher level cannot be corrected on the lower

Domain situation
You misunderstood their needs

Data/task abstraction
You're showing them the wrong thing

Visual encoding/interaction idiom
The way you show it doesn't work

Algorithm
Your code is too slow

Nested model - Validation

Domain situation
Observe target users using existing tools

Data/task abstraction

Visual encoding/interaction idiom
Justify design with respect to alternatives

Algorithm
Measure system time/memory
Analyze computational complexity

Analyze results qualitatively

Measure human time with lab experiment (*lab study*)

Observe target users after deployment (*field study*)

Measure adoption

Visualization

Why?
Task Abstraction

Part I: Why do we need to abstract tasks?

Dr. Alessio Arleo

Summary - Information Visualization

“The purpose of information visualization is to amplify cognitive performance, not just to create interesting pictures."

[Card. 1999]

“Solving a problem simply means representing it so as to make the solution transparent.”

[Simon, 1996]

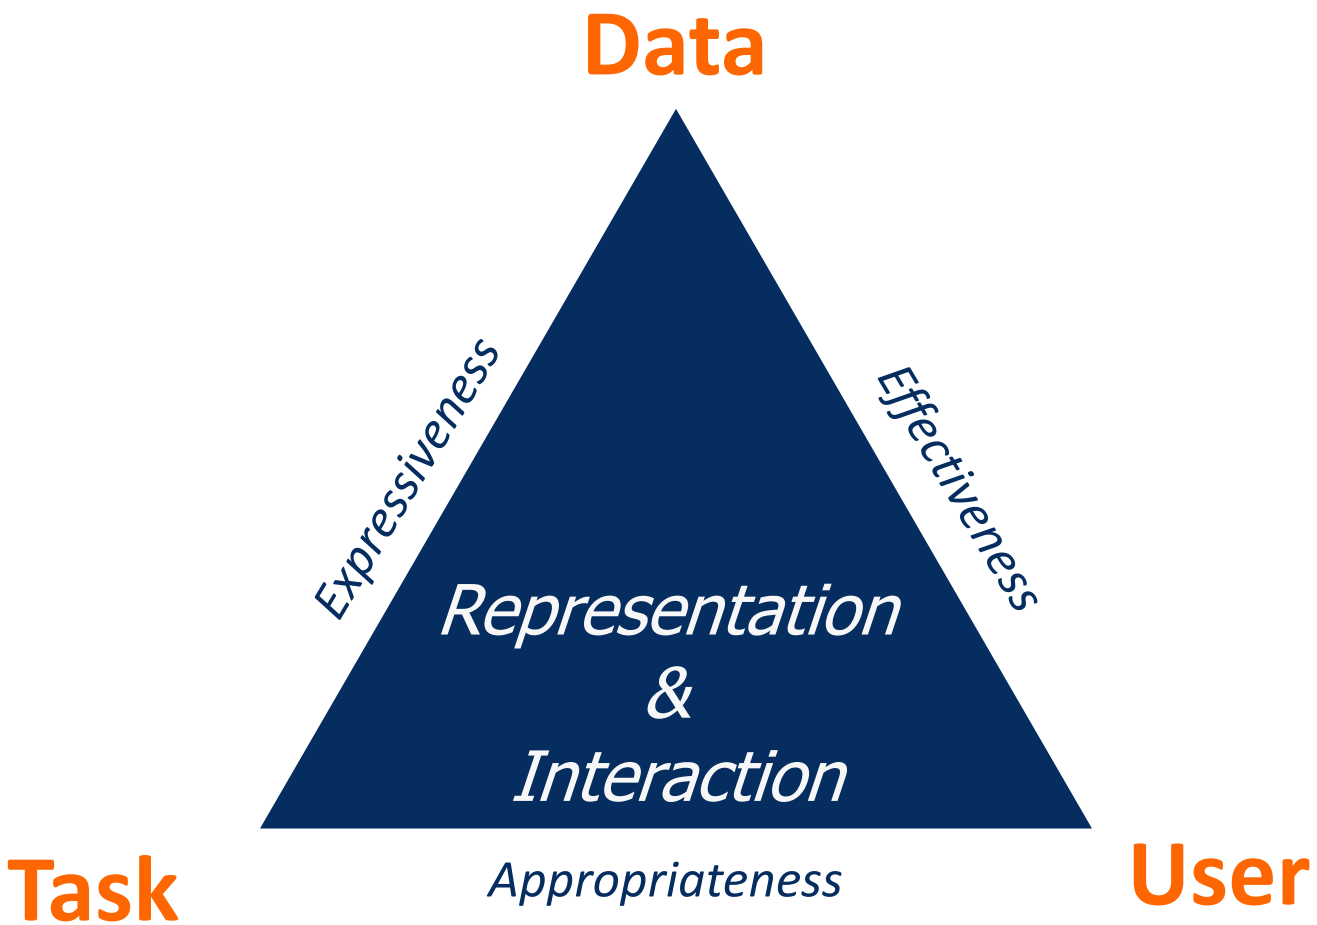
[Matejka and Fitzmaurice, 2017]

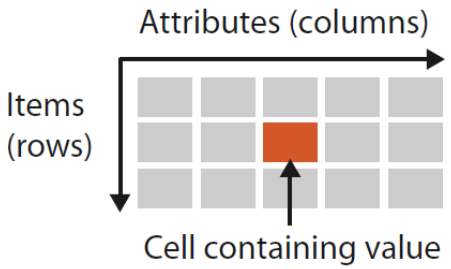
Visual representations of **datasets** and **interactions** designed to help **people** carry out **tasks** more **effectively**

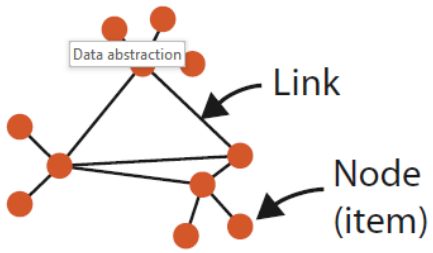
Users, Data, Tasks

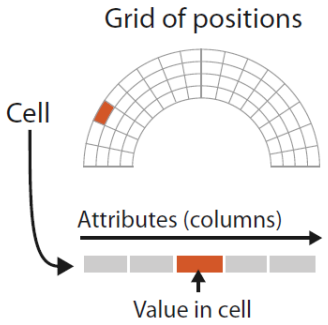


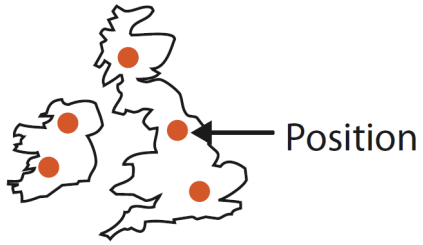
[Miksch and Aigner., 2013]

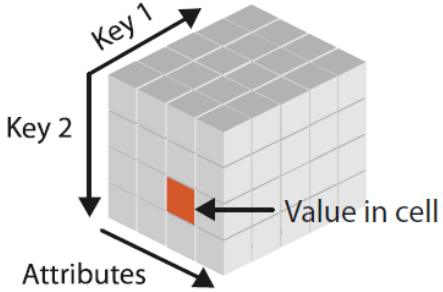
What Data? Data Types











There’s Data in your Coffee!

Quantitative	Ordinal	Nominal
Describes a measurable physical dimension	Categorical Variables with an implied order	Describe categories with no ordering
Temperature, quantity, weight, age…	First, second, third…. Small, Medium, Large…	Single-player, FPS, Sports, MOBA…

Nested Design Model

Domain situation
Who are the users?

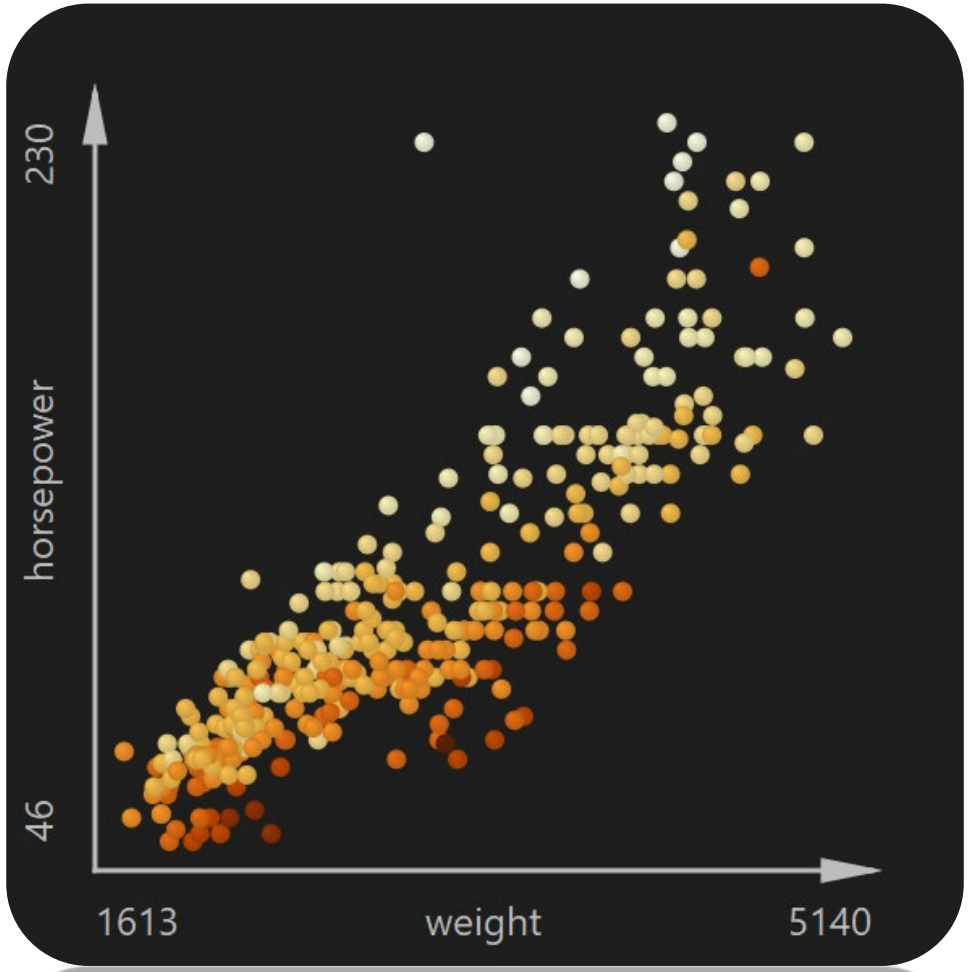
Data/task abstraction
What data & tasks do they have?

Visual encoding/interaction idiom
What visualization & interaction to achieve tasks?

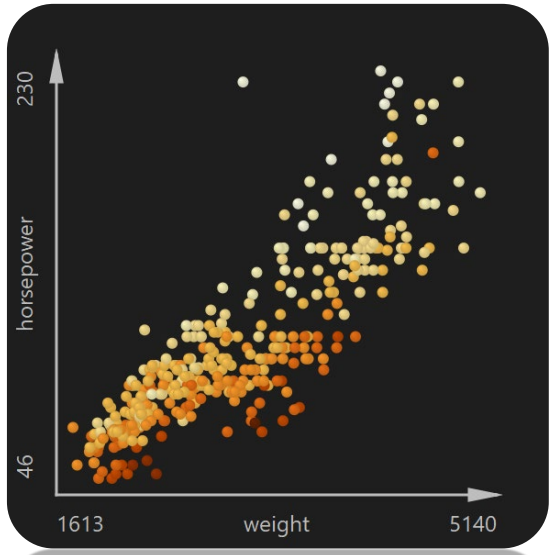
Algorithm
What automated methods can support?

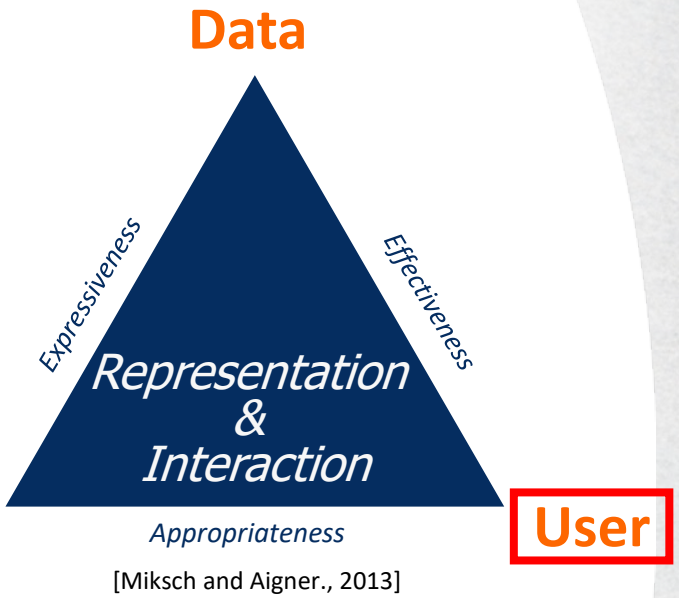
Munzner, Tamara. Visualization analysis and design. CRC press, 2014.

Is this a good Visualization?



Domain Characterization





[Miksch and Aigner., 2013]

Domain situation
Who are the users?

- Speak domain language

Data/task abstraction
What data & tasks do they have?

Why we need Abstraction?

Domain Questions might be:

- Too vague or not relevant
- Hard to understand without domain knowledge
- Hard to match to a proposed solution

We need to translate domain language into more abstract structures

Reason about the most appropriate **encodings**

Reflect about **differences** and **commonalities**

Task Abstraction

"Contrast the prognosis of patients who were intubated in the ICU more than one month after exposure to patients hospitalized within the first week"

"See if the results for the tissue samples treated wih LL-37 match up with the ones without the peptide"

Compare attribute values between two groups

Tasks pose constraints on design

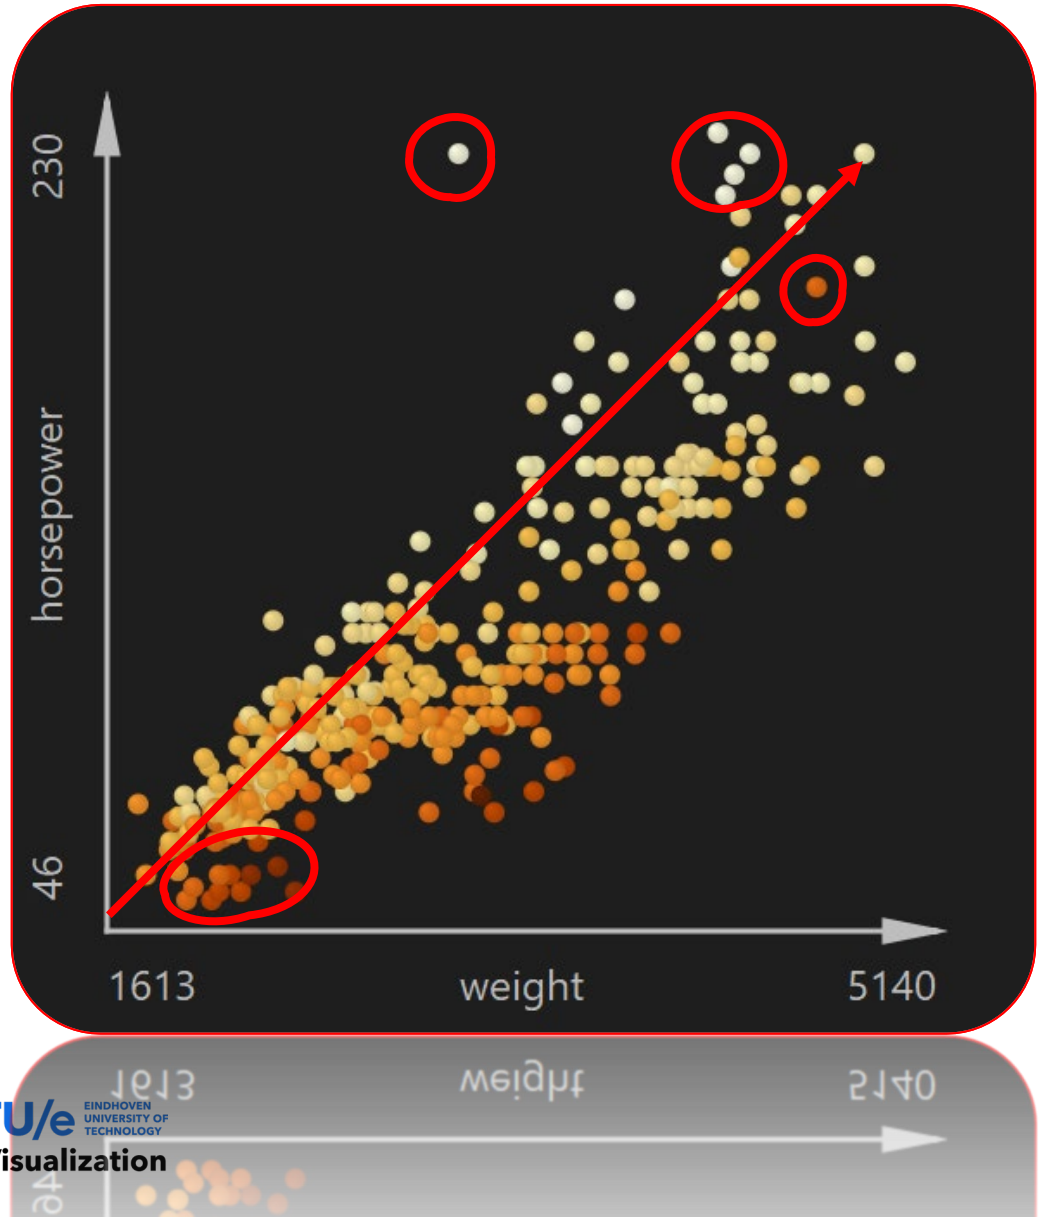
A Crucial Passage

Helps visualization designer to reason about a right visualization (encoding).

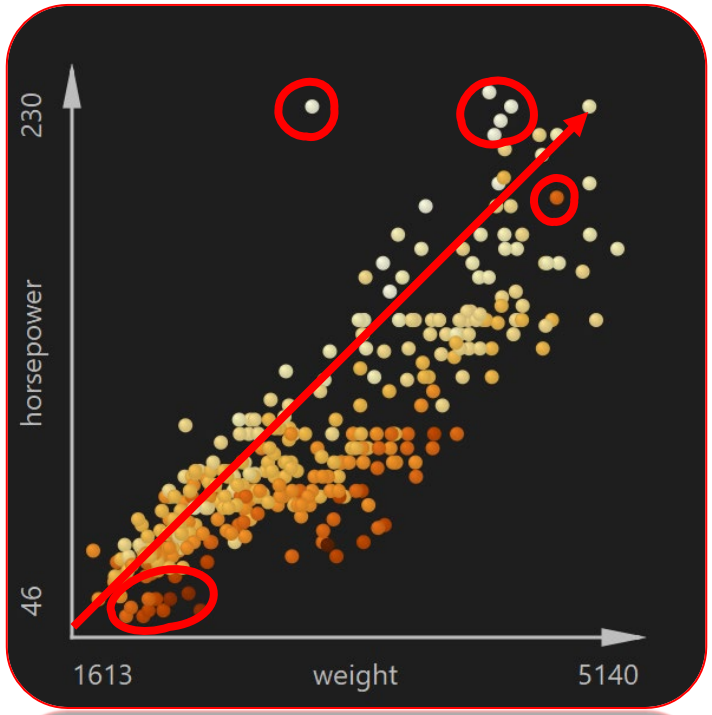
Tasks provide a constraint on design

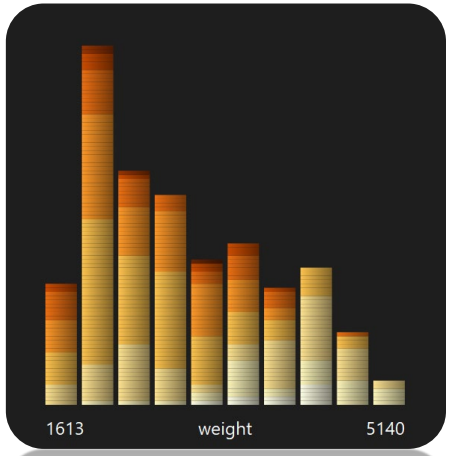
- No visual representation supports all tasks
- Efficacy depend on the situation/user
- Depends on the goal of the visualization

Is this a good Visualization?



Is this a good Visualization?





Takeaway Messages

The design you choose influences the tasks a user can do.

For every visualization you design, ask yourself:

- What information can I extract out of this representation.
- What is the problem that I am trying to solve?
- What questions do I want my user to be able to answer looking at this?
- How much effort is needed…
- How much confidence...

Can we do this in a more structured way?

How?
Principles and Ranking

Prof. dr. Anna Vilanova

How to select Visual Encodings?

- Expressiveness principle

  Show all but only what is in the data.

  Match the channel/mark to data characteristics.

- Effectiveness principle (salience):

  Encode the most important attributes with highest ranked channels.

How to select Visual Encodings?

How do we represent color?

- 3 dimensions since 3 cones

- **Device Oriented**: Physical realization
  - Screen **RGB** space (3 lamps)
  - Printer **CMY**(K)

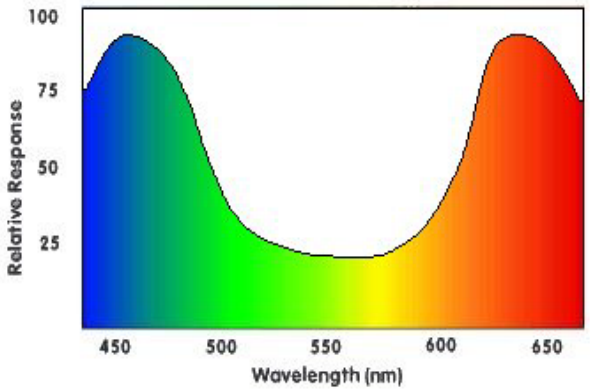
  - Simple
  - Each device has its own space
  - Represents a part of the human visible colors

http://color.lukas-stratmann.com/

How do we represent color?

Semantic: Intuitive properties of color **HSL/HSV**

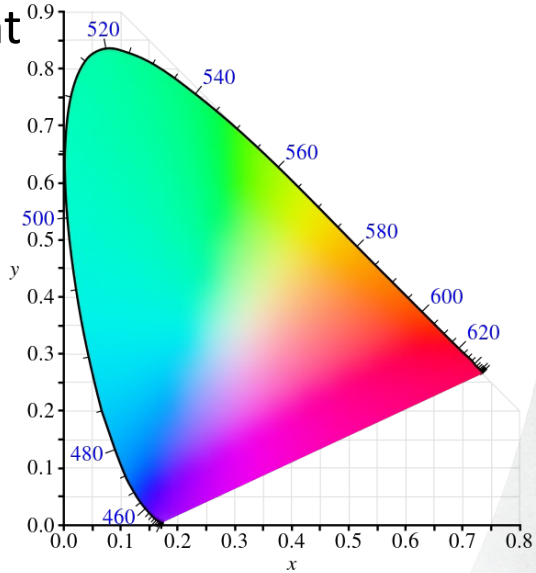
- Hue: the color wheel
- Saturation: how much grey
- Light/Value: how much light/brightness s



How do we represent all human visible color?

CIE 1931 XYZ color

- Represent all human visible colors
- Build through experimentation
- Mathematical formulation
- Device independent
- Easy conversion



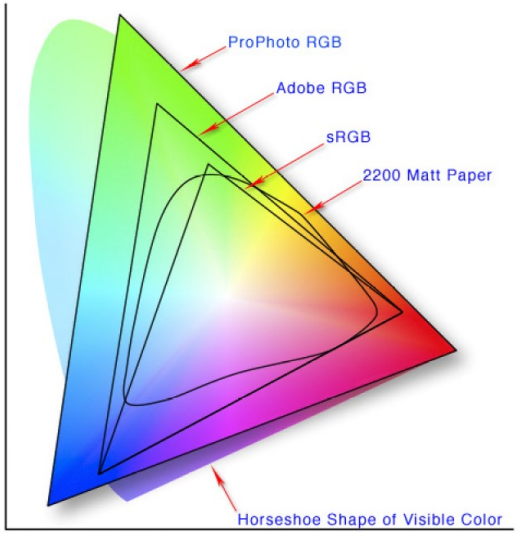
X-Y independent of lightness

How do we represent all human visible color?

CIE 1931 XYZ color

- Represent all human visible colors
- Build through experimentation
- Mathematical formulation
- Device independent
- Easy conversion

Other models RGB/CMY gamut represents a part of CIE 1931

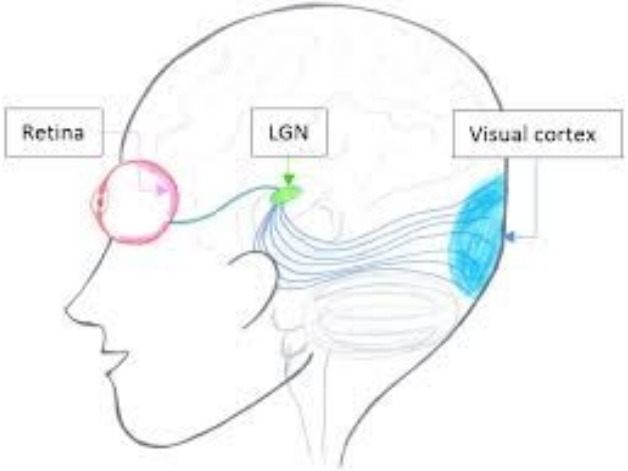


https://en.wikipedia.org/wiki/Color_space

Perception

Our visual system also includes bias

- Green is slightly better distinguishable
- Blue perception is very weak
- We are very sensitive to luminance



Doi: 10.1117/12.2262696

Blurring one channel

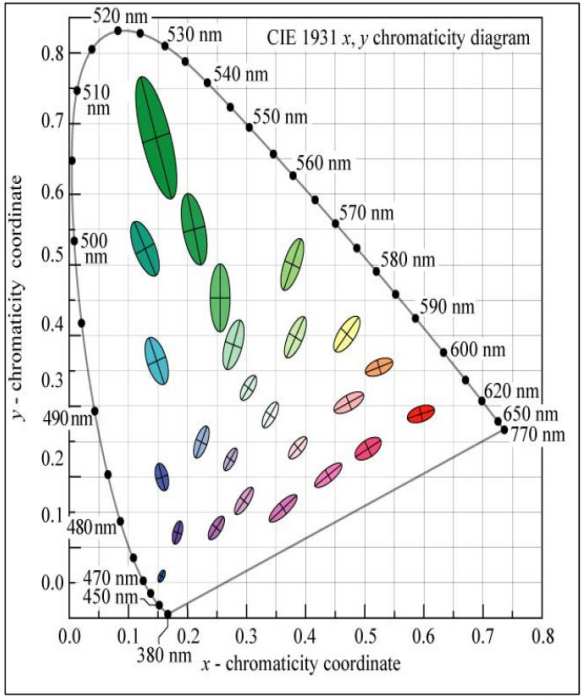
Blue is Blurred

Green is Blurred

Based on Elmar Eisemann slides

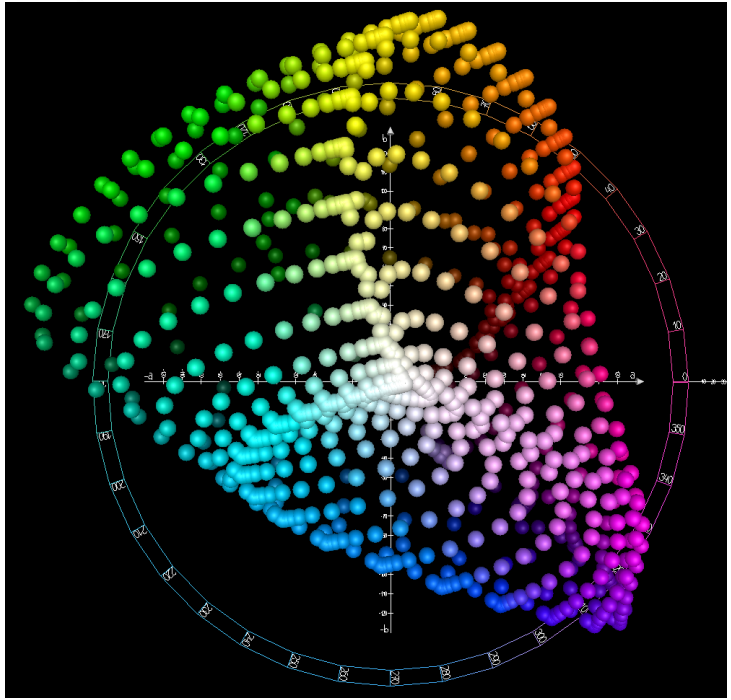
How do we represent color?

- MacAdam's Ellipses



How do we represent color?

- CIELUV,CIELAB, (L*,a*,b*)



How do we represent color?

Perceptually uniform

- MacAdam's Ellipses
  - indistinguishable color grouped
  - ellipse indicates noticeable difference

- **CIELUV,CIELAB**, (L*,a*,b*)
  - Deformation of CIE space
  - Euclidean distance corresponds to perceptual difference

Perception

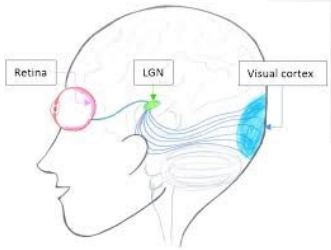
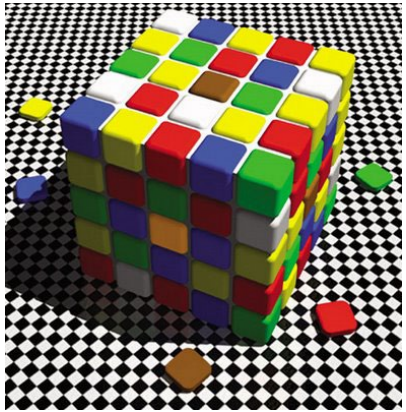
R. Beau Lotto

Perception



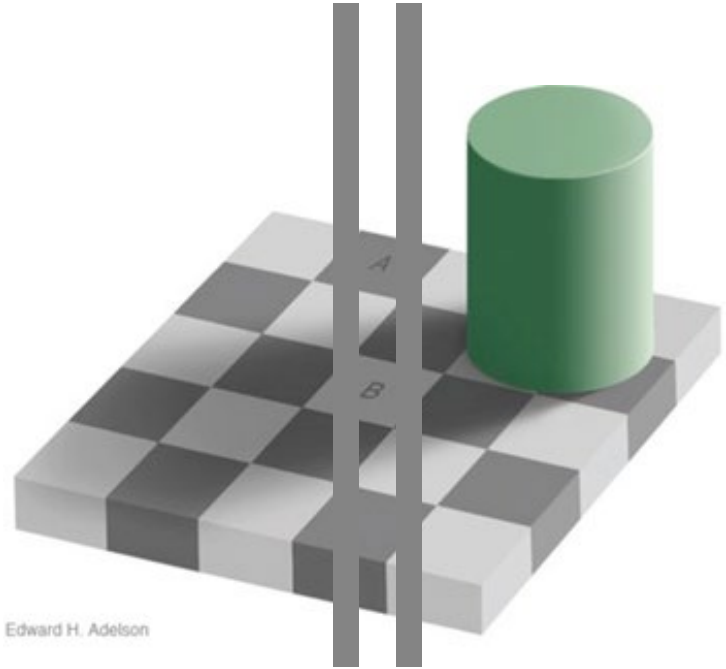
- Colors are not evaluated independently
- Perception is complex
- Our brain uses information according to its experience.
- Context is relevant



R. Beau Lotto

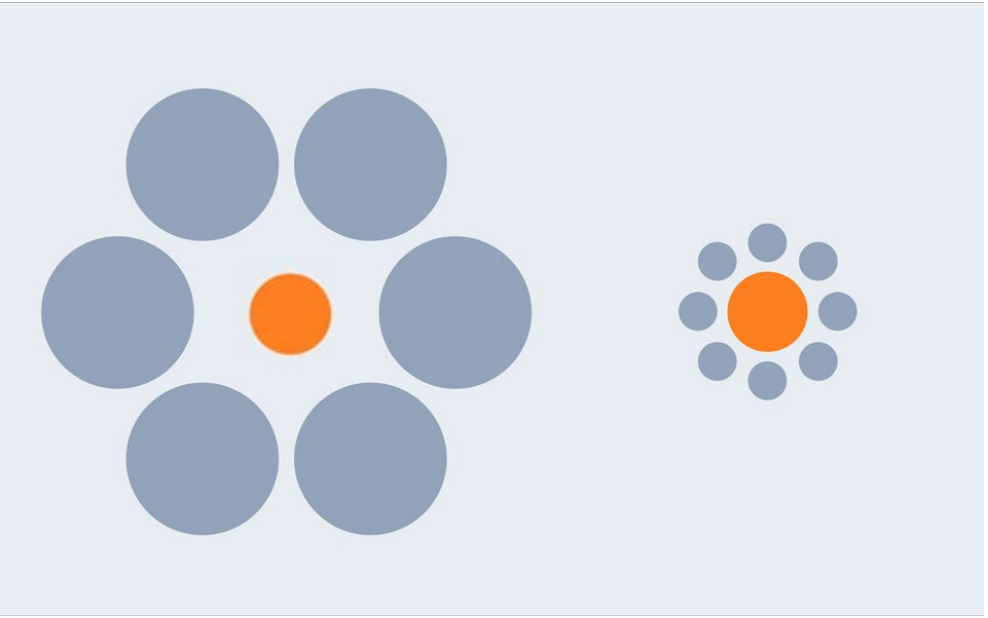
Perception: Absolute vs Relative

Contrast vs absolute luminance



Perception: Absolute vs Relative

Also other visual channels, size …



Perception: Absolute vs Relative

Weber Law

- Perceptual system mostly operates with relative judgments, not absolute
- Smallest change in stimuli that is perceived (ΔS) to background stimuli (S) is constant (k)

$$\frac{\Delta S}{S} = k$$

Perception: Absolute vs Relative

Accuracy increases with common frame/scale and alignment

- filled rectangles 1:9, difficult judgement
- white rectangles 1:4, easy judgement

How?

Principles, Advice, and Guidelines

Prof. dr. Anna Vilanova

How can we select Visual Encodings?

- Visual encodings: Marks and Visual Channels
- Expressiveness and Effectiveness
- Rankings based on:
  accuracy, discriminability, separability, popout
- Color as a visual channel
- Principles, Advice and Guidelines

Principles, Advice and Guidelines

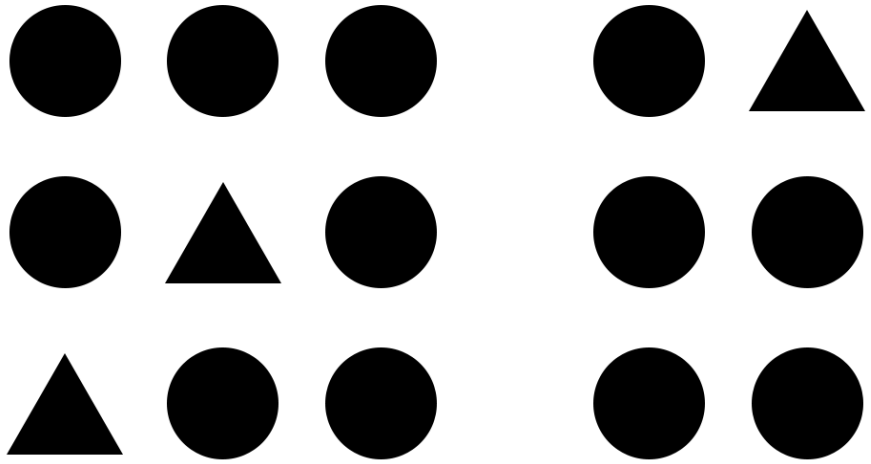
- Gestalt Principles
- Tufte's Principles

Gestalt Principles (1920s)

- How human perception groups elements, sees patterns, and simplifies information
- How humans create a whole from parts
- Commonly used in design (e.g., web design)
- Multiple principles

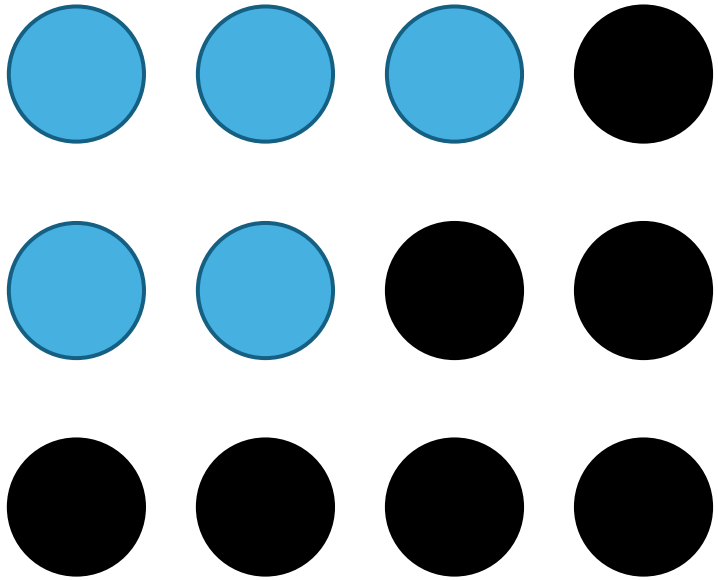
Proximity (Emergence)

We group elements that are close to each other



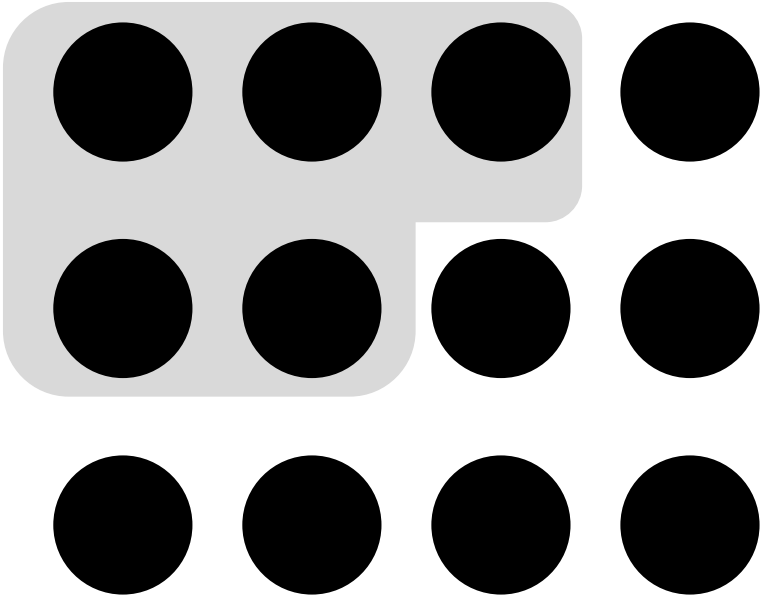
Similarity

We tend to group elements with similar appearance



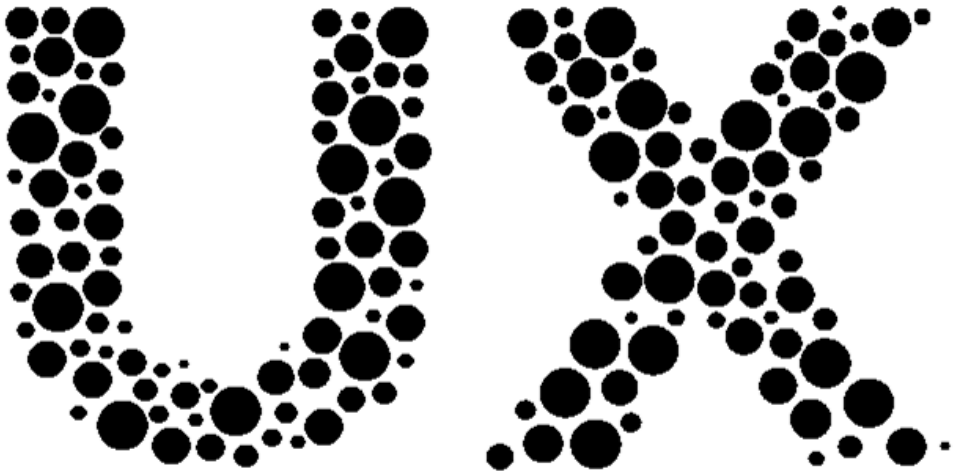
Common Region

We group elements that are in the same enclosed regions



Good Figure

Objects grouped together tend to be perceived as a single figure



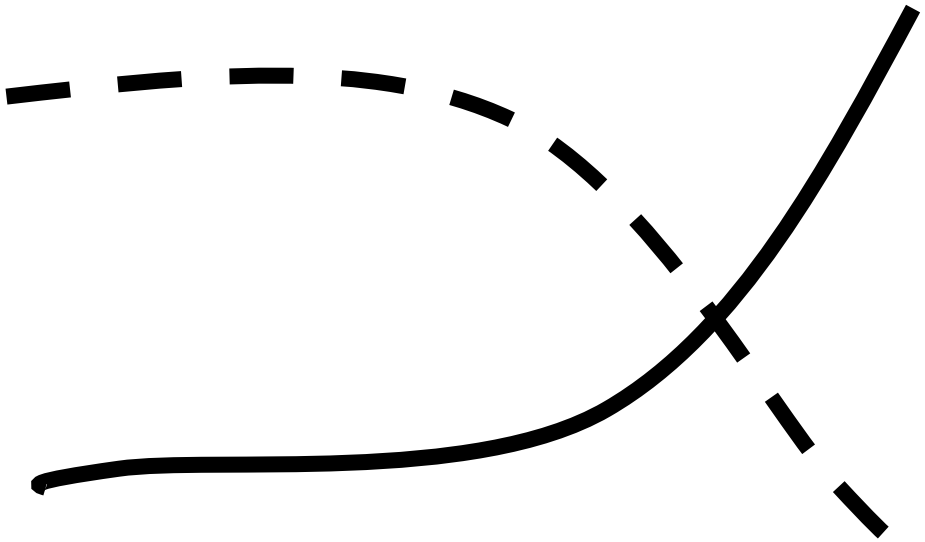
Closure (Reification)

We complete missing parts

source: Gizmodo

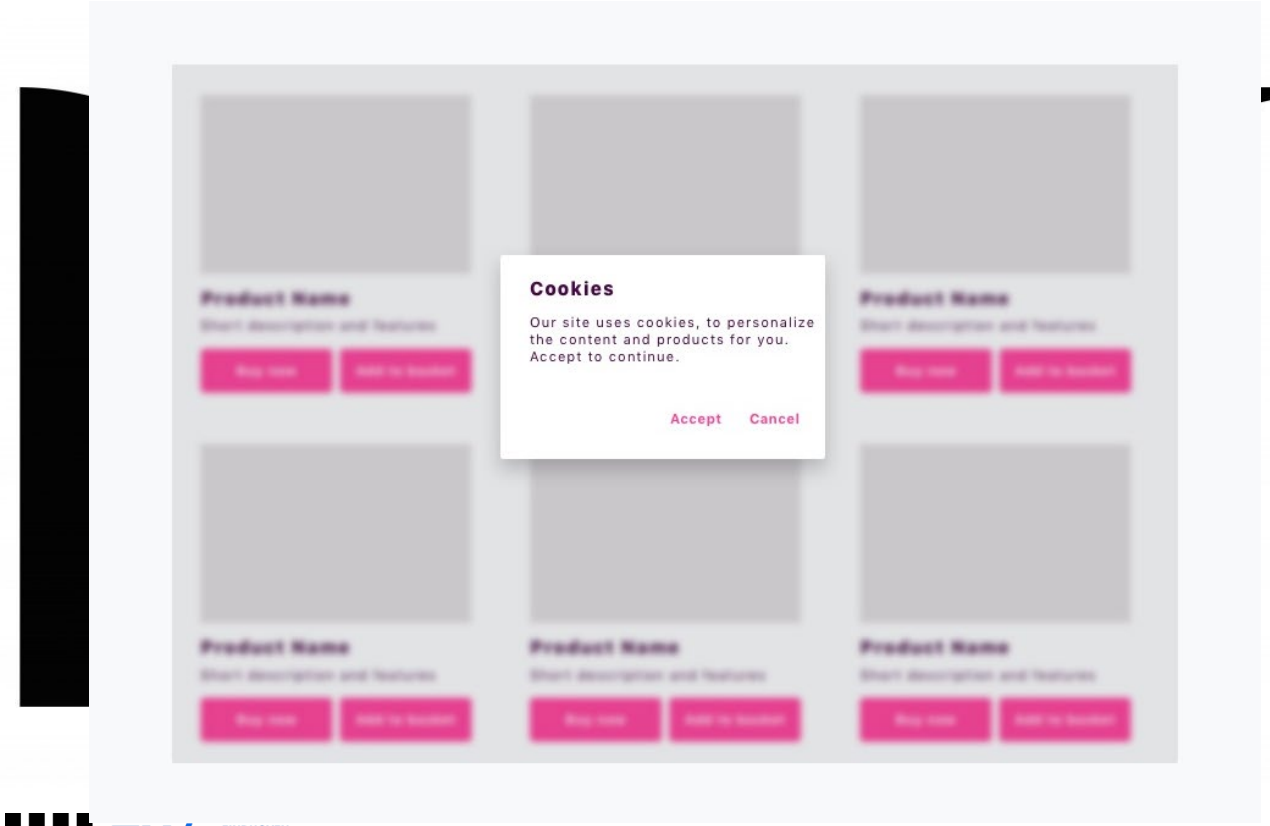
Continuity

We tend to form and group continuous lines from pieces



Figure/Ground (Multi-stability)

We see depending on our perception of figure or background.

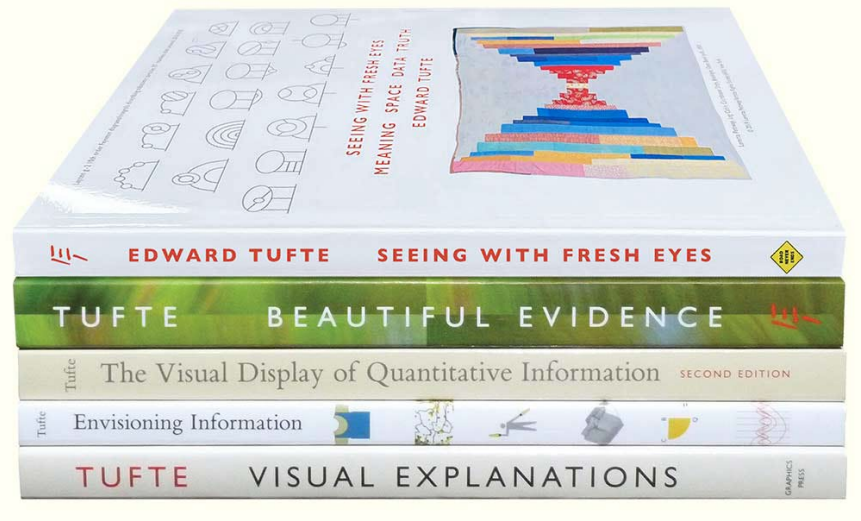


Principles, Advice and Guidelines

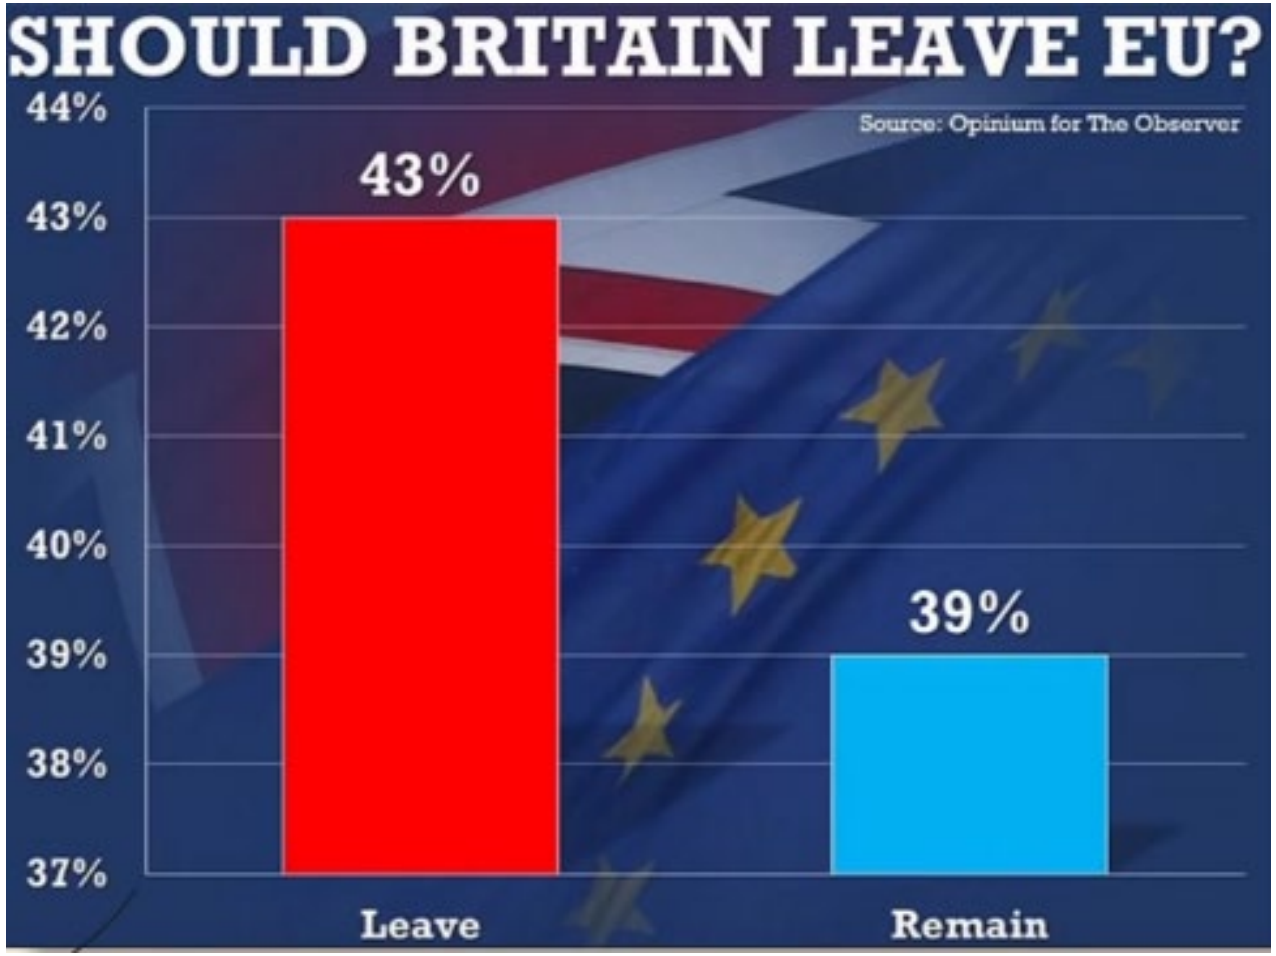
- Gestalt Principles
- Tufte's Principles

Tufte's principles

- Graphical integrity
  - Missing scales
  - Scale distortion
- Design principles
  - Maximize data-ink ratio
  - Avoid chart junk

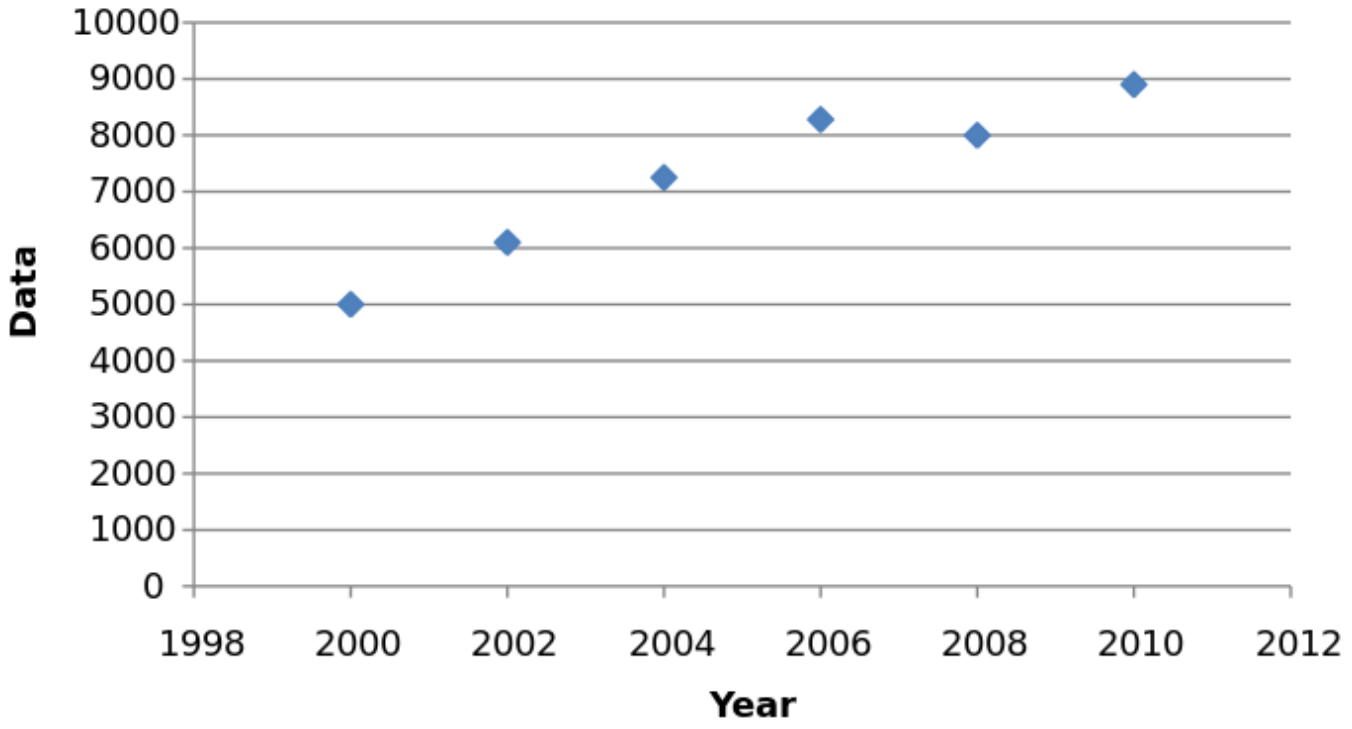


Missing scales – Scale distortion

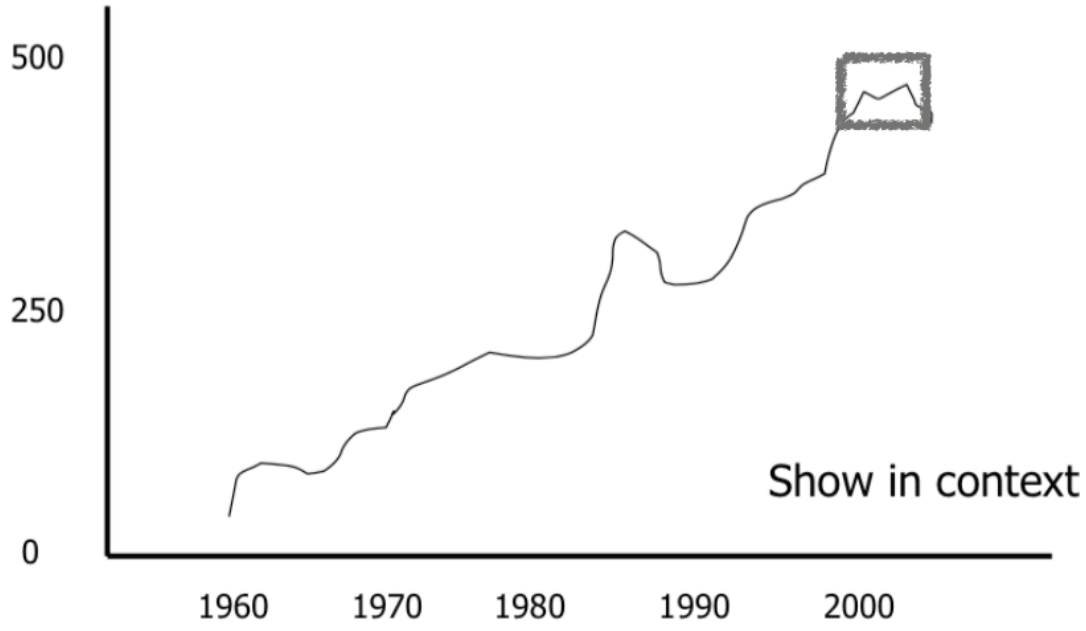


https://en.wikipedia.org/wiki/Misleading_graph#/media/File:EU_3.png

Scale Distortion



Scale Distortion



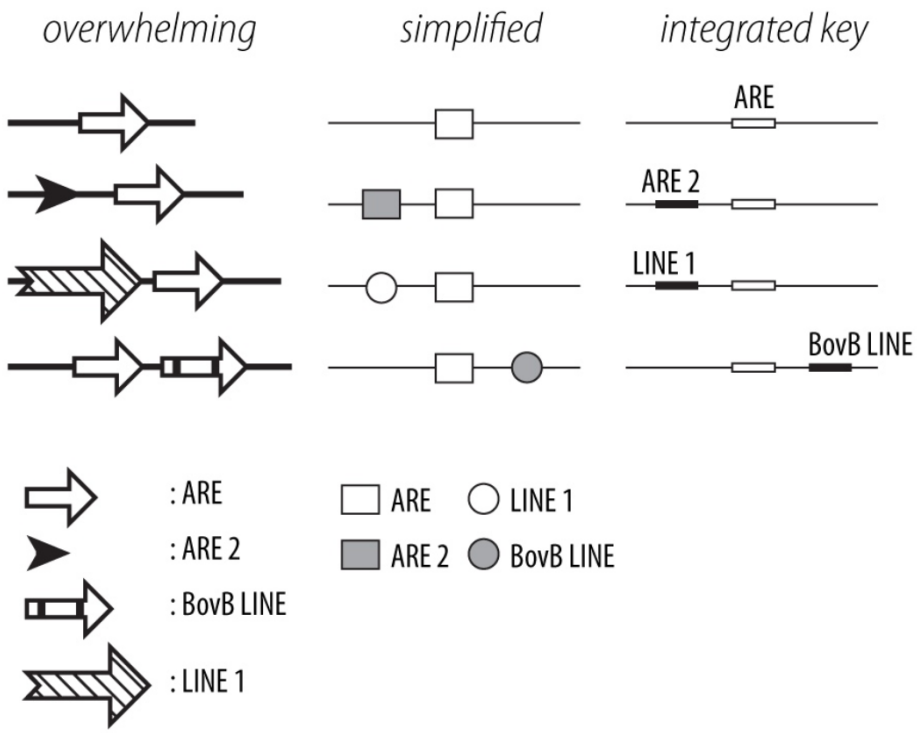
Maximize data-ink ratio

$$data\ ink\ ratio = \frac{data\ ink}{total\ ink\ used\ in\ the\ graphic}$$

https://eazybi.com/blog/data_visualization_and_chart_types/

Avoid chart junk

Remove redundancy



Nikaido et al., Phylogenetic relationships among cetartiodactyls based on insertions of short and long interspersed elements: Hippopotamuses are the closest extant relatives of whales. Proceedings of the National Academy of Sciences 96:10261-10266, 1999.

Principles, Advice and Guidelines

- Gestalt Principles
- Tufte's Principles
  - Graphical integrity
  - Maximize data-ink ratio
  - Avoid chart junk

Visualization

Principles, Advice, and Guidelines

Dangers of Depth (3D)

Resolution Beats Immersion

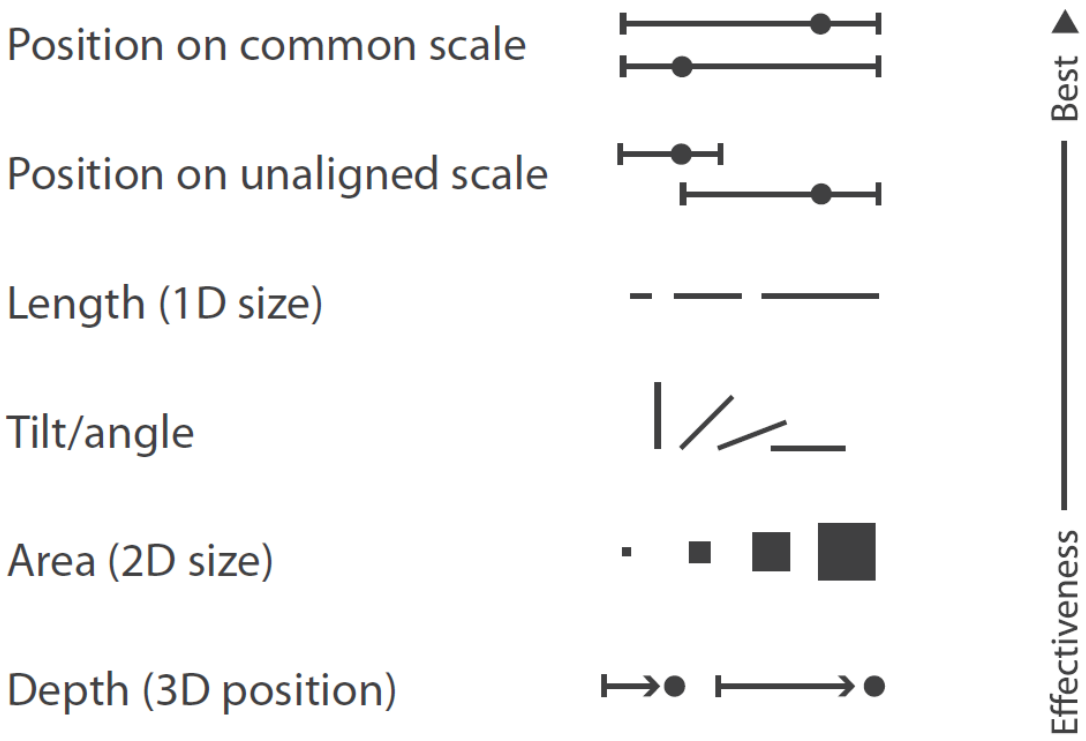
Prof. dr. Anna Vilanova

Principles, Advice and Guidelines

- Dangers of Depth (3D)
- Resolution Beats Immersion
- Eyes beat Memory

Dangers of depth

Ranking for **planar** spatial position, not depth



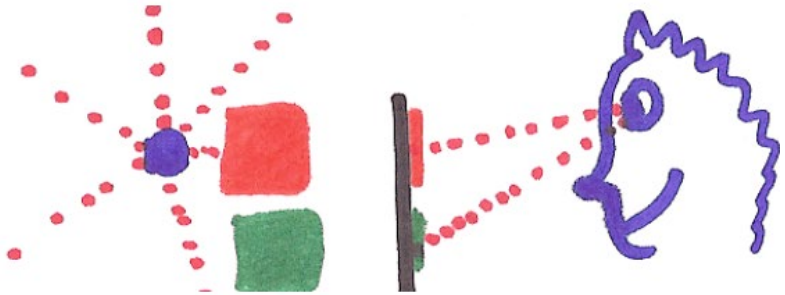
Dangers of depth

Ranking for **planar** spatial position,not depth

We do not really *see* 3D, we see 2.05D

- We see 2D projections brain combines into depth
- Motion parallax depth from view point movement
- Occlusion is not resolved

Wiggle stereoscopy
https://en.wikipedia.org/wiki/Wiggle_stereoscopy



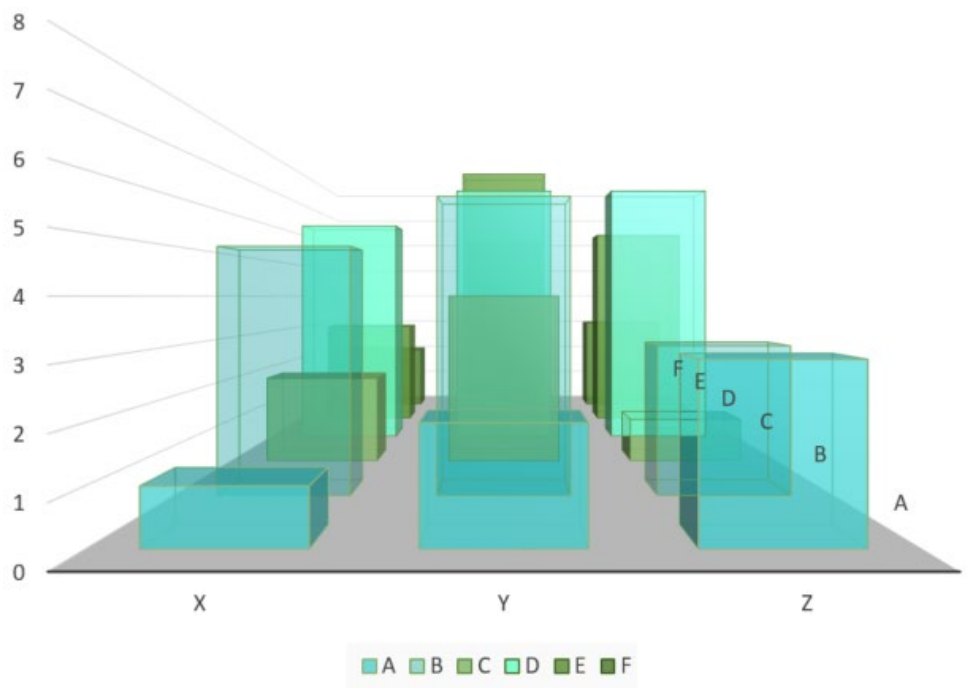
Difficulties of 3D

- Occlusion
- Interaction complexity
- Difficult text legibility

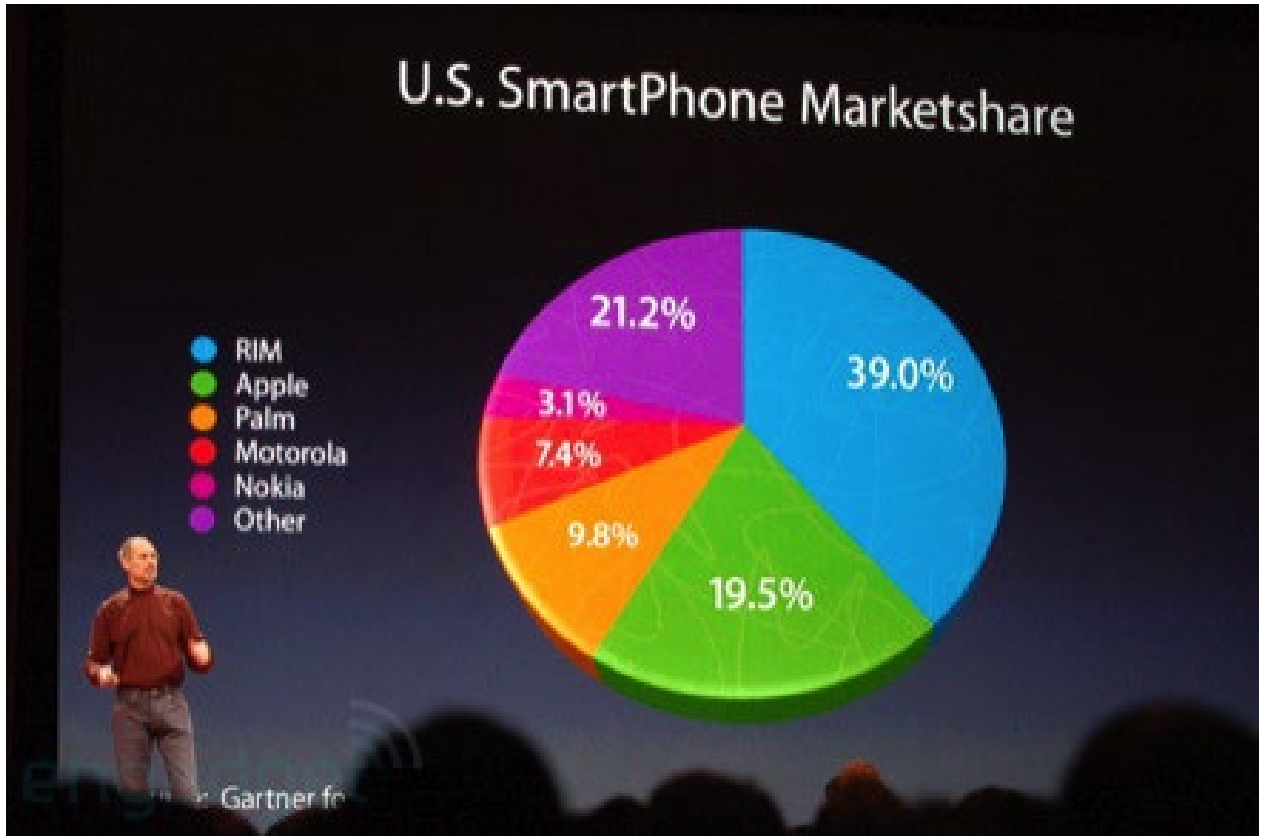
Difficulties of 3D

Perspective distortion

- Interferes with all-size channel encodings
- The power of the plane is lost!



Perspective Distortion

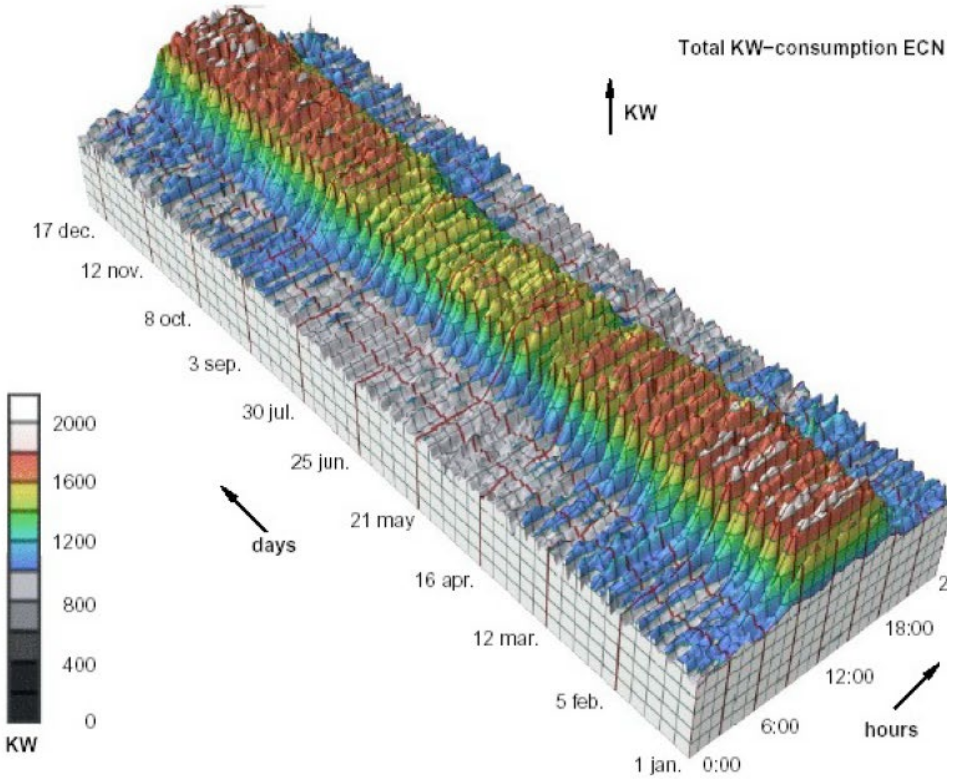


Steve Jobs – Keynote 2008

http://www.engadget.com/2008/01/15/live-from-macworld-2008-steve-jobs-keynote

Dangers of depth example

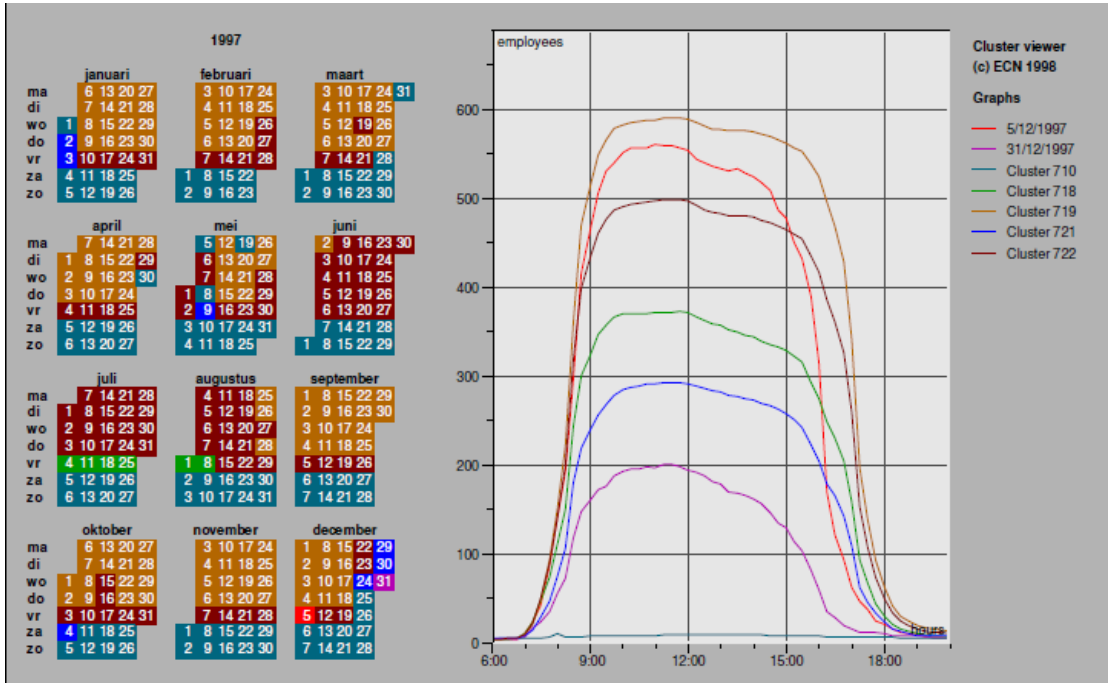
Detailed comparisons impossible



Cluster and Calendar based Visualization of Time Series Data.
van Wijk and van Selow, Proc InfoVis 99.

Transformation to a suitable abstraction

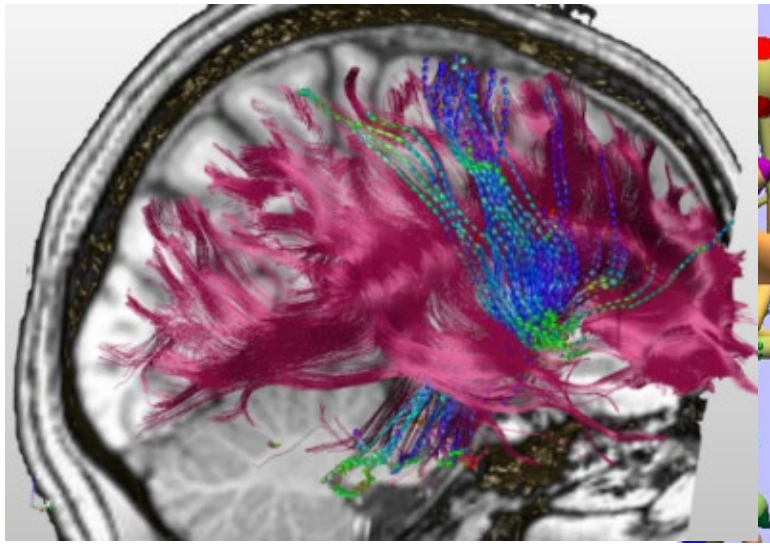
- Derived data (clusters)
- Multiple views: calendar, superimposed 2D curves



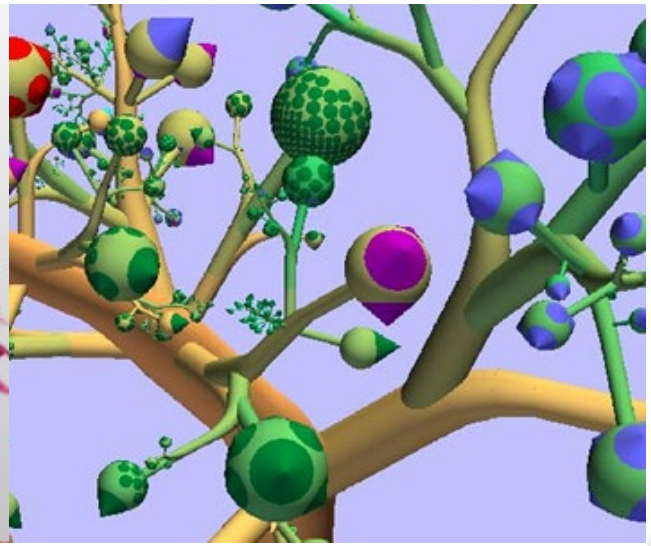
Cluster and Calendar based Visualization of Time Series Data.
van Wijk and van Selow, Proc InfoVis 99.

Dangers of depth: must justify

- 3D legitime for true 3D **spatial data** – shape understanding
- 3D needs very careful justification for **non-spatial data**



Brain white matter fibrous structure



Botanical Visualization of Huge Hierarchies
Kleiberg et al. 2001

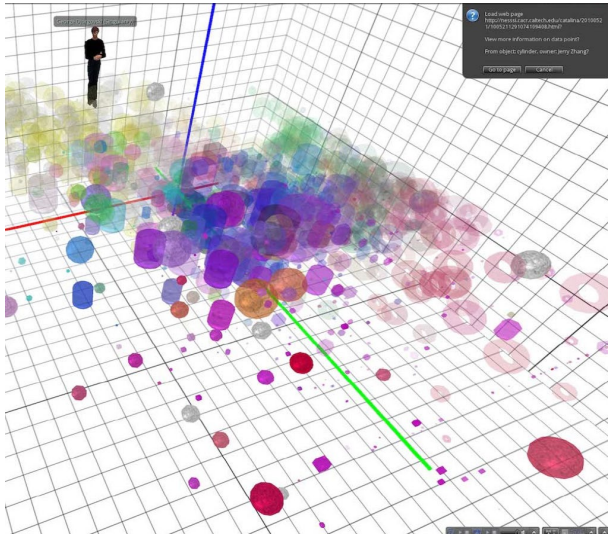
www.win.tue.nl/~vanwijk/botatree.pdf

Principles, Advice and Guidelines

- Dangers of Depth (3D)
- Resolution Beats Immersion
- Eyes beat Memory

Resolution beats Immersion

- Resolution much more important (pixels scarcest resource)



- Desktop better for workflow integration
- Virtual Reality - Immersion

  For non-spatial data very difficult to justify

  Do not need sense of presence or stereoscopic 3D

Principles, Advice and Guidelines

- Dangers of Depth (3D)
- Resolution Beats Immersion
- Eyes beat Memory

Principles, Advice and Guidelines

- Gestalt Principles
- Tufte's Principles

- Dangers of Depth (3D)
- Resolution Beats Immersion
- Eyes beat Memory

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

Principles, Advice, and Guidelines

Eyes beat Memory

Prof. dr. Anna Vilanova

Principles, Advice and Guidelines

- Dangers of Depth (3D)
- Resolution Beats Immersion
- Eyes beat Memory

Eyes beat Memory

- Long-term memory – unlimited
- Short-term memory

  working memory – has a limit

reaching the limit implies cognative load

Short-term memory

Try to memorize as many words as you can in two minutes:

Nine	Swap	Cell	Ring	Lust
Plugs	Lamp	Apple	Table	Sway
Army	Bank	Fire	Hold	Worm
Clock	Horse	Color	Baby	Sword
Desk	Grab	Find	Bird	Rock

https://www.verywellmind.com/a-short-term-memory-experiment-2795664

Short-term memory

- Try to write down as many words as possible.
- How many did you manage?

- Most people can hold five to nine words in short-term memory

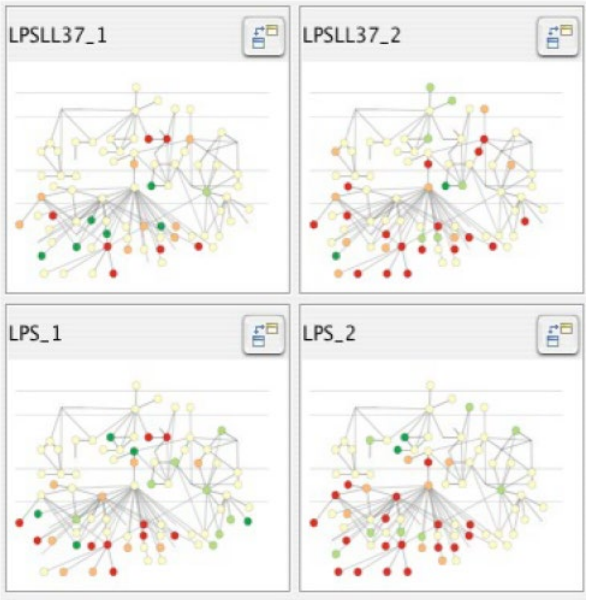
https://www.verywellmind.com/a-short-term-memory-experiment-2795664

Eyes beat Memory

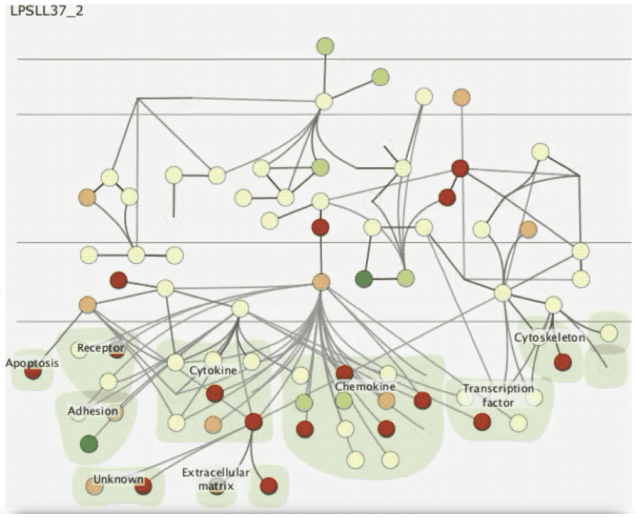
- Long-term memory – unlimited
- Short-term memory
  working memory – has a limit reaching the limit implies cognative load
- Attention
  very limited attention for conscious visual search tasks

Animation vs Side by Side

- Side by side views easy to compare (low cognitive load) by moving eyes
- Animation hard to compare visible items to memory of what you saw



Side by side views (Small multiples)



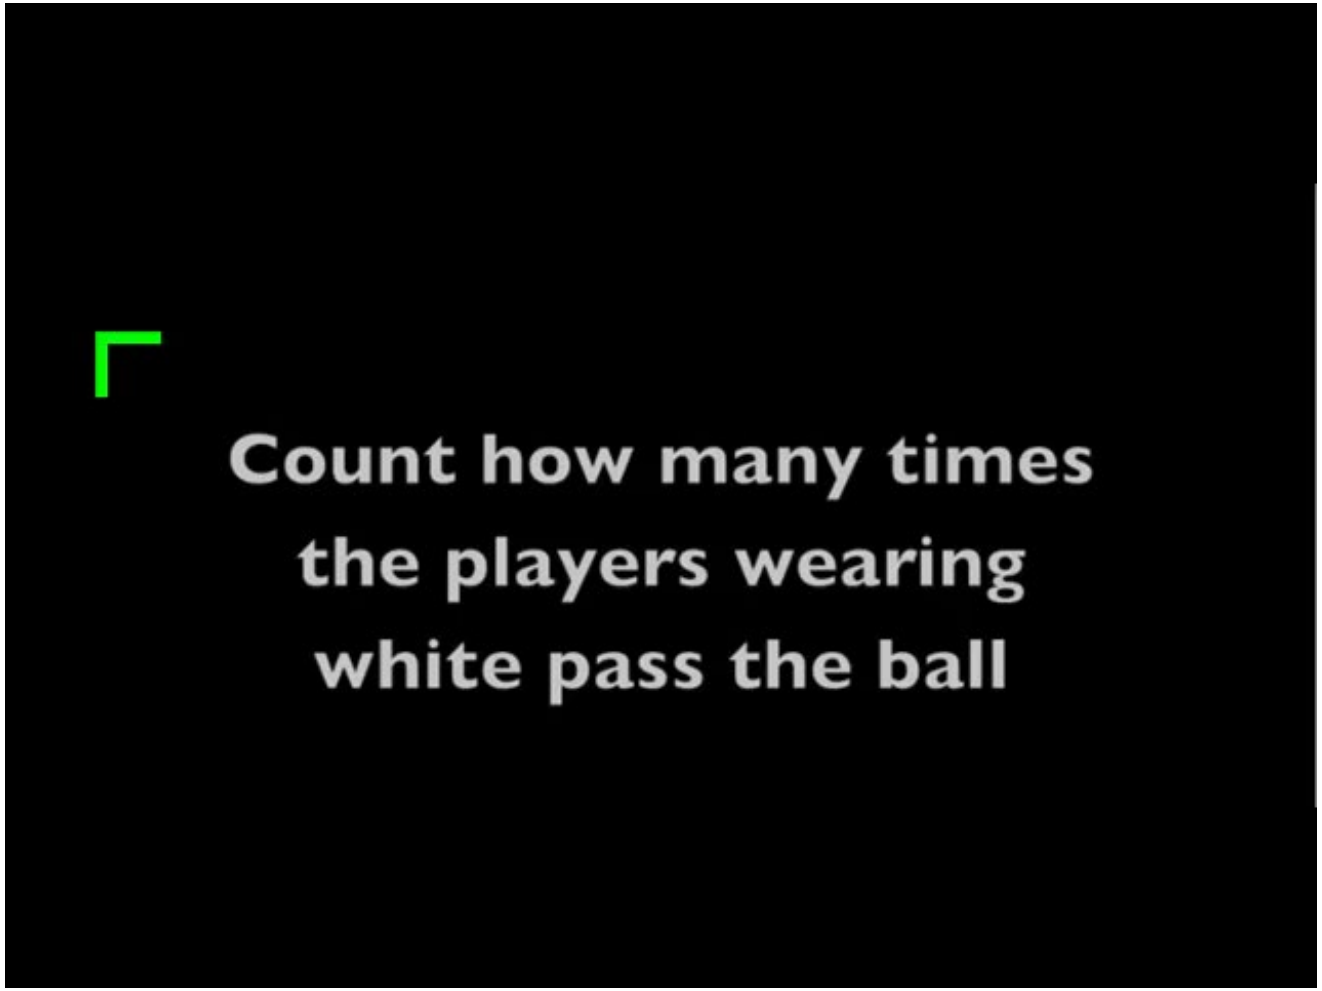
Animation

Cerebral: Visualizing Multiple Experimental Conditions on a Graph with Biological Context. Barsky, Munzner, Gardy, Kincaid. IEEE InfoVis 2008.

Animation

- Great for choreographed storytelling (localized action)
- Great for transition between two states/data sets
- Give control to the user on the animation (re-play, stop, pause)

Change Blindness



https://www.youtube.com/watch?v=IGQmdoK_ZfY

Animation

- Great for choreographed storytelling (localized action)
- Great for transition between two states/data sets
- Give control to the user on the animation (re-play, stop, pause)
- **Change blindness :** Poor for many states with changes everywhere

Time vs Space

literal	abstract
animation	small multiples
show time with time	show time with space

Animation: can it facilitate? Tversky et al.
Intl Journ Human-Computer Studies, 57(4):247-262, 2002.

Principles, Advice and Guidelines

Task abstraction

What

Data abstraction

+

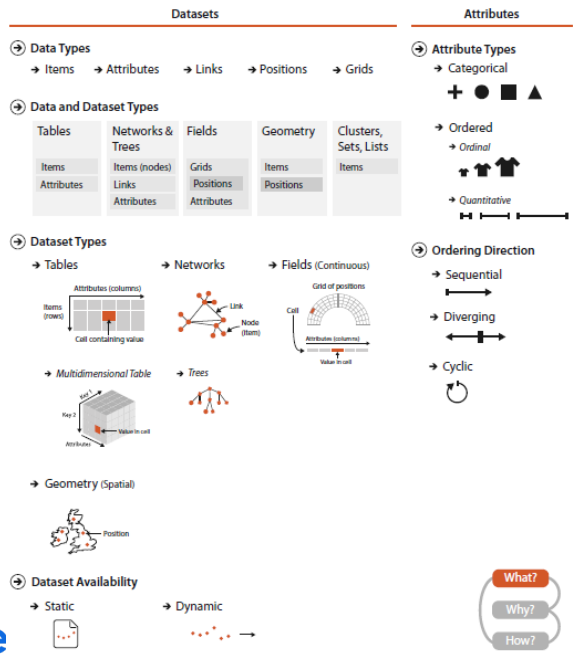
Why

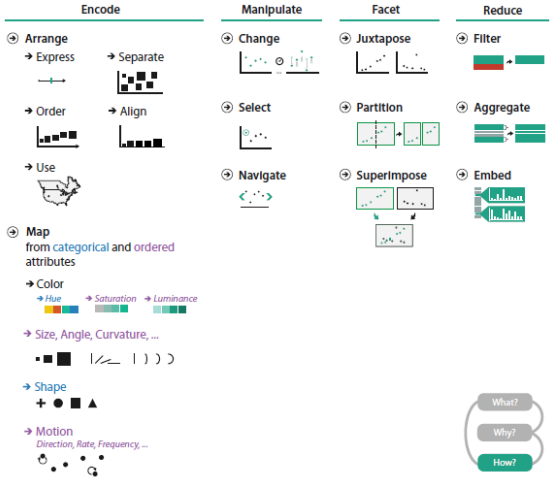
Task abstraction (action,target)

→

How

Visual encoding + interaction





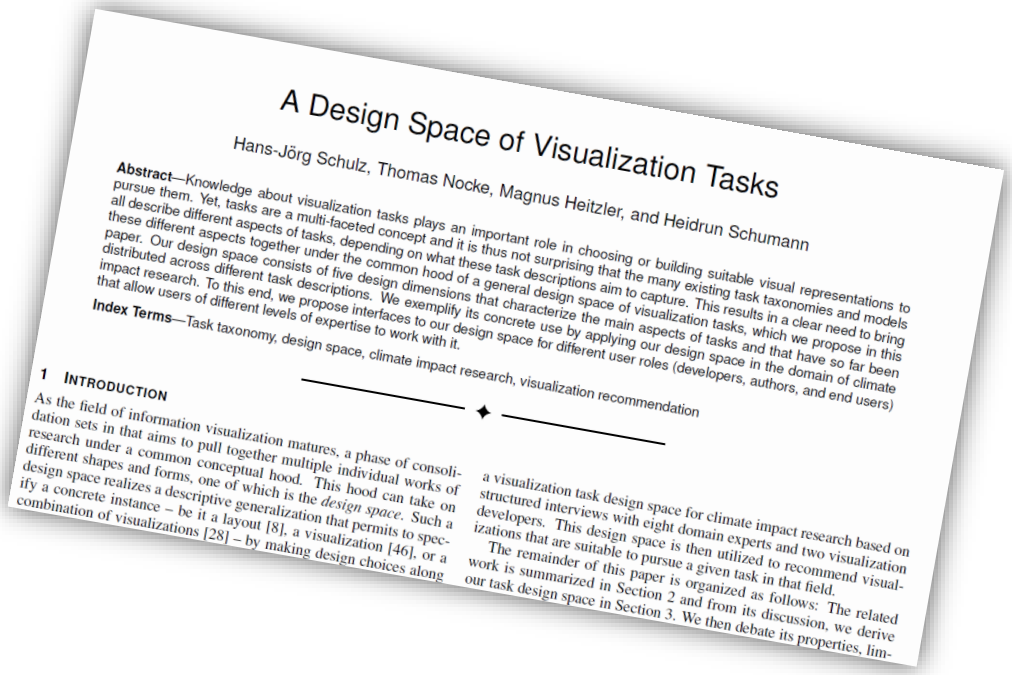
Summary task abstraction

Transform domain specific language into abstract form to reason about similarities & differences

Helps visualization designer to <u>reason</u> about a right visualization (encoding).

Not complete, complex operations, combinations, sequences…

Other models exist



A Design Space of Visualization Tasks

Hans-Jörg Schulz, Thomas Nocke, Magnus Heitzler, and Heidrun Schumann

Abstract—Knowledge about visualization tasks plays an important role in choosing or building suitable visual representations to pursue them. Yet, tasks are a multi-faceted concept and it is thus not surprising that the many existing task taxonomies and models all describe different aspects of tasks, depending on what these task descriptions aim to capture. This results in a clear need to bring these different aspects together under the common hood of a general design space of visualization tasks, which we propose in this paper. Our design space consists of five design dimensions that characterize the main aspects of tasks and that have so far been distributed across different task descriptions. We exemplify its concrete use by applying our design space in the domain of climate impact research. To this end, we propose interfaces to our design space for different user roles (developers, authors, and end users) that allow users of different levels of expertise to work with it.

Index Terms—Task taxonomy, design space, climate impact research, visualization recommendation

1 INTRODUCTION

As the field of information visualization matures, a phase of consolidation sets in that aims to pull together multiple individual works of research under a common conceptual hood. This hood can take on different shapes and forms, one of which is the *design space*. Such a design space realizes a descriptive generalization that permits to specify a concrete instance – be it a layout [8], a visualization [46], or a combination of visualizations [28] – by making design choices along

a visualization task design space for climate impact research based on structured interviews with eight domain experts and two visualization developers. This design space is then utilized to recommend visualizations that are suitable to pursue a given task in that field.

The remainder of this paper is organized as follows: The related work is summarized in Section 2 and from its discussion, we derive our task design space in Section 3. We then debate its properties, lim-

Visualization

Idioms and interaction

n keys and 1 value

Dr.ir. Stef van den Elzen

Analysis framework

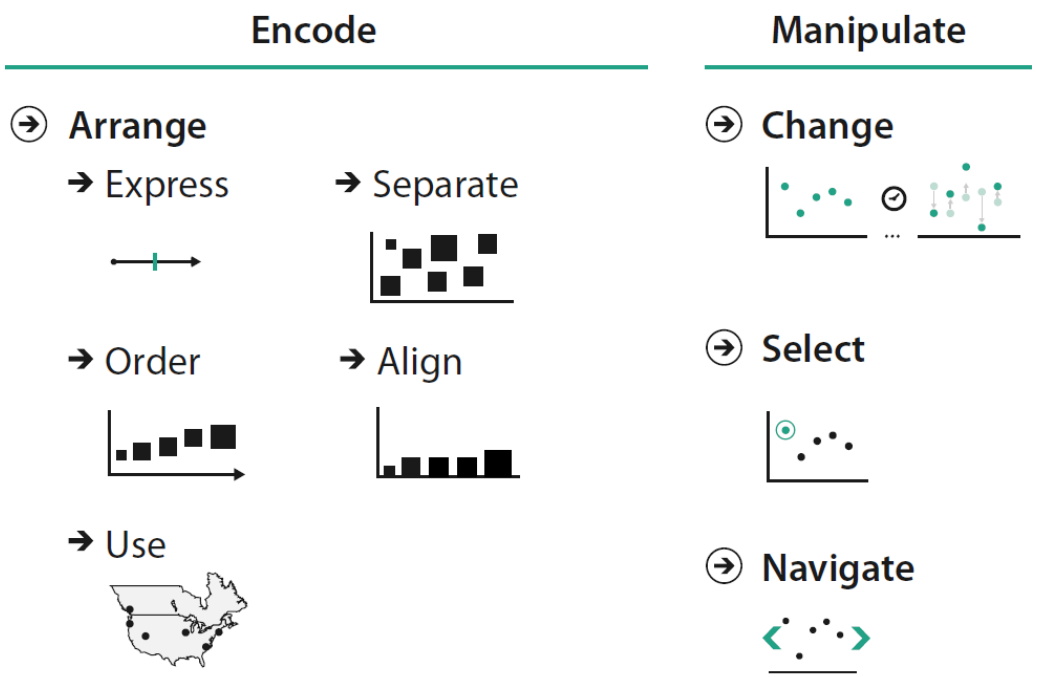
- What is shown?
  data abstraction

- Why is the user looking at it?
  task abstraction

- **How** is it shown?
  Visual encoding and interaction

Visualization idioms

- Different chart types
- Information visualization techniques (design choices)

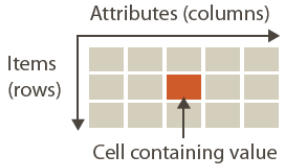


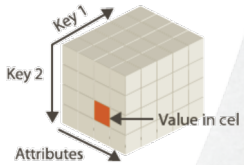
Visualization idioms

- Focus on visualization of tabular data
- Idioms put restrictions on tasks, so **choose carefully**
- Idioms are described with:

Data: *what is the data behind the chart?*
- Number of categorical attributes
- Number of quantitative attributes
- Semantics of keys and values

Key: person_id, value: height
- Key used as index
- Value of cell in table
- Multidimensional table: multiple keys





Mark: *which visual elements are used?*
- Points, lines, glyphs, etc.

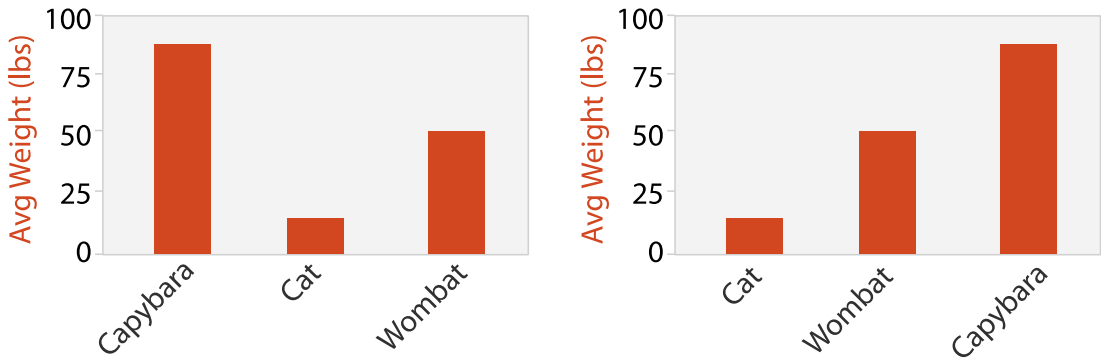
Channels: *How is the data encoded?*
- Arrangement & mapping

Tasks: *what are the supported tasks?*
- Discover trends, outliers, distribution …

Idioms with *n* keys and 1 value

Bar chart

Ordered by key vs. ordered by value (data-driven)



Data: *what is the data behind the chart?*

- 1 Categorical attribute (key)
- 1 Quantitative attribute (value)

Mark: *which visual elements are used?*

- Lines

Channels: *How is the data encoded?*

- Length to convey quantitative value
- Spatial regions: one per mark

Tasks: *what are the supported tasks?*

- Compare, lookup values

Scalability? → Hundreds of levels for key attribute

Bar chart

https://carlmanaster.github.io/datastripes-canvas/index.html

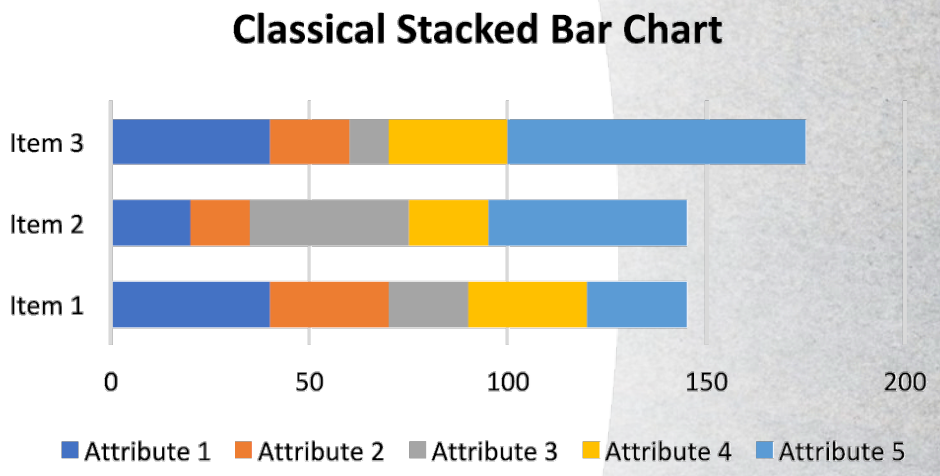
Stacked Bar Chart

Data:
- 2 Categorical attribute (keys)
- 1 Quantitative attribute (value)

Mark:
- Stack of line marks

Channels:
- Length and color hue
- Spatial regions: one per mark
  - Aligned: first bar
  - Unaligned: other bars

Tasks:
- Compare, lookup values
- Part-to-whole relationship



Scalability? → Hundreds of levels for key attribute
Stacked attribute: several to one dozen

Stacked Bar Chart

Source: Indratmo, Lee Howorko, Joyce Maria Boedianto, Ben Kai Daniel: The efficacy of stacked bar charts in supporting single-attribute and overall-attribute comparisons. Vis. Informatics 2(3): 155-165 (2018)

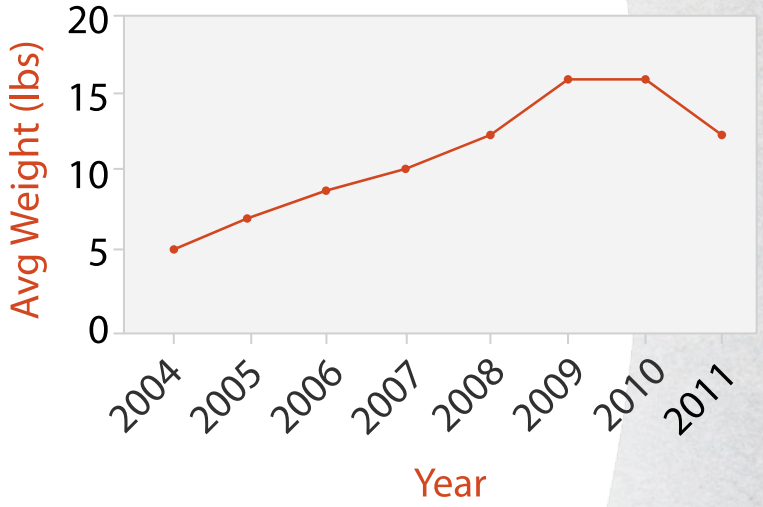
Line chart

Data:
- 2 Quantitative attributes
- One key, one value

Mark:
- Points, line connecting marks

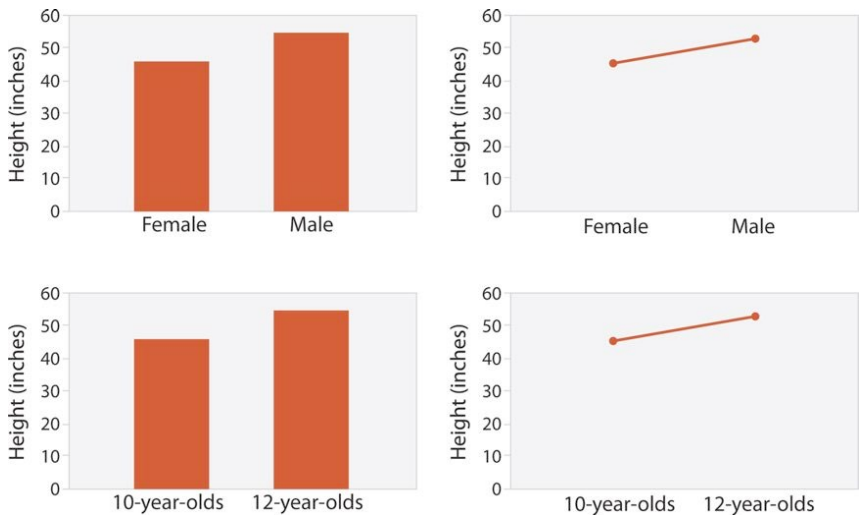
Channels:
- Aligned lengths to express quantitative value
- Separated and ordered by key attribute into horizontal regions

Tasks:
- Find trends
- Connection marks emphasize ordering of items along key axis → show relationship



Scalability? → Key attribute dozens to hundreds

Choosing bar vs. line chart



Depends on type of key attributes

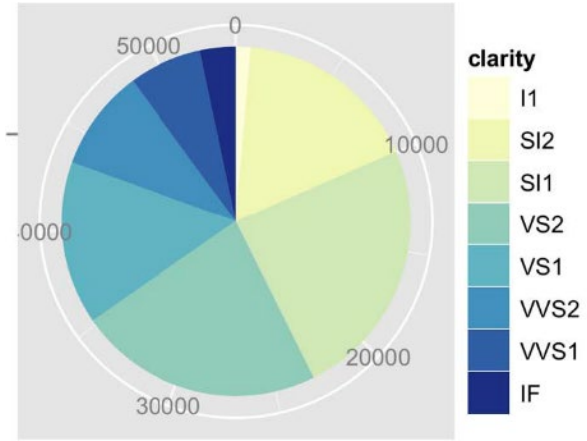
- bar charts if categorical
- line chart if ordered

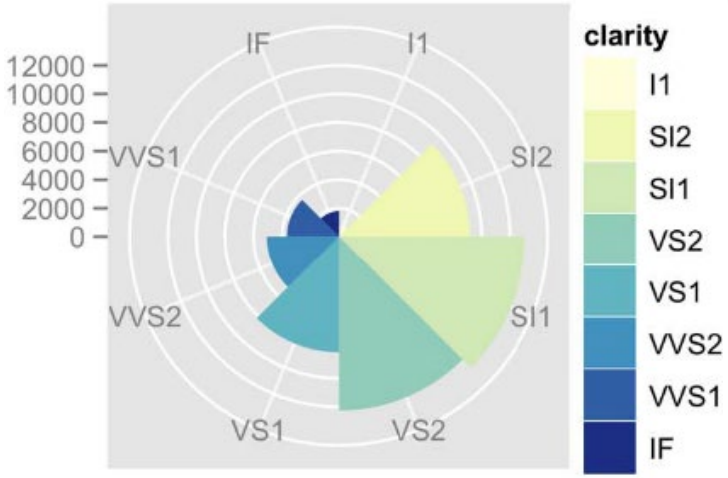
Do not use line charts for categorical key attributes

- violates expressiveness principle
- implication of trend so strong that it overrides semantics. *"The more male a person is, the taller he/she is".*

after [Bars and Lines: A Study of Graphic Communication. Zacks and Tversky. Memory and Cognition 27:6 (1999), 1073–1079.]

Pie chart, polar area chart





Data:
- 1 Categorical attribute (key)
- 1 Quantitative attribute (value)

Mark:
- Separate colored area

Channels:
- Color by categorical attribute
- Angle for quantitative attribute

Tasks:
- Part-to-whole judgement

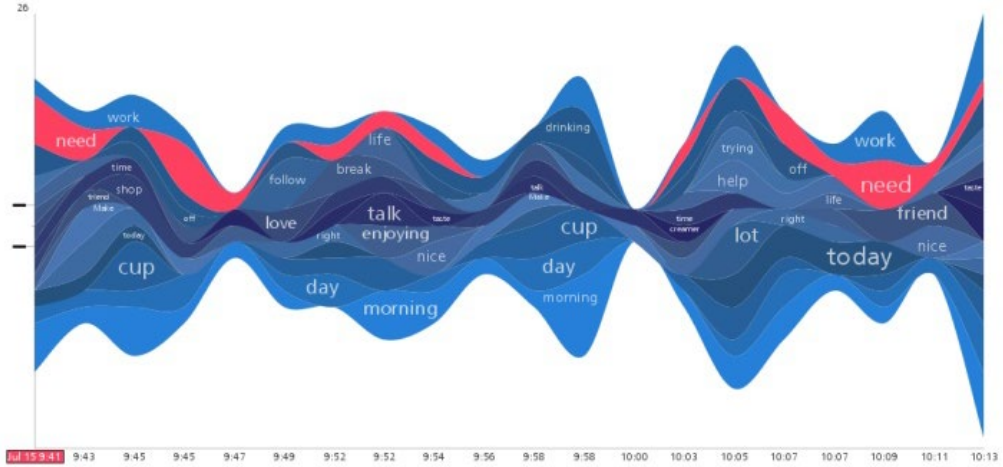
Scalability? → One dozen

[A layered grammar of graphics. Wickham. Journ. Computational and Graphical Statistics 19:1 (2010), 3–28.]

Pie chart, polar area chart

Streamgraph

Generalized stacked graph
Emphasizes horizontal continuity



Data:

- 1 Categorical key attribute (names)
- 1 Ordered key attribute (time)
- 1 Quantitative value attribute (counts)

Marks & channels:

- Derived geometry: layers, height encodes counts.

Tasks:

- Find trends, part-to-whole relationship

Scalability? → Hundreds of time keys
Dozens to hundreds of (names) keys

- More than stacked bars, since most layers don't extend across whole chart

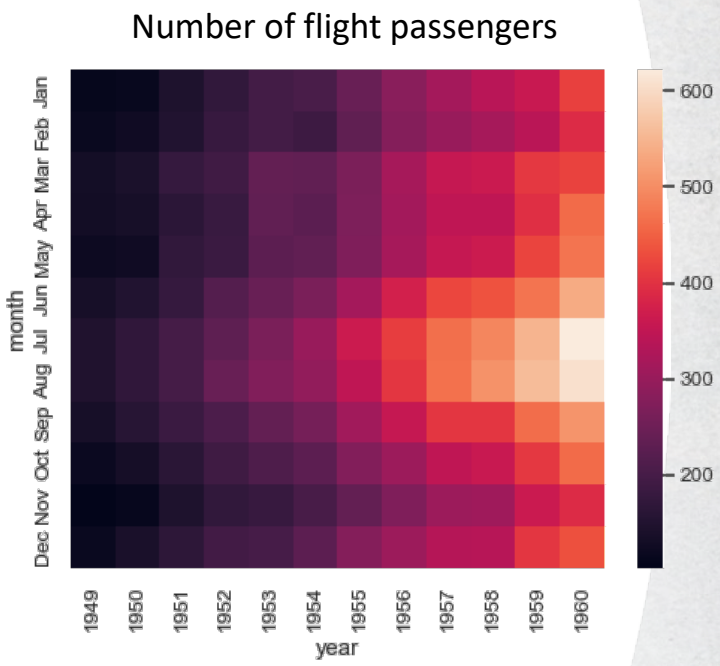
Heatmap

Data:
- 1 Quantitative attribute
- Two keys, one value

Mark:
- Separate and align in 2D matrix
- Indexed by 2 attributes

Channels:
- Color by quantitative attribute

Tasks:
- Find clusters, outliers, patterns

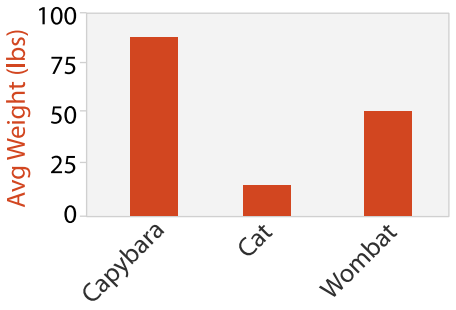


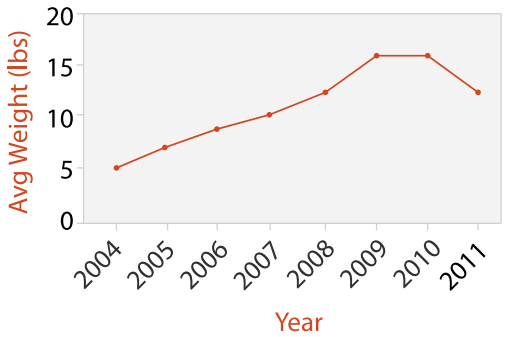
Scalability? → 1M items, 100s of categorical levels, ~10 quantitative attribute levels

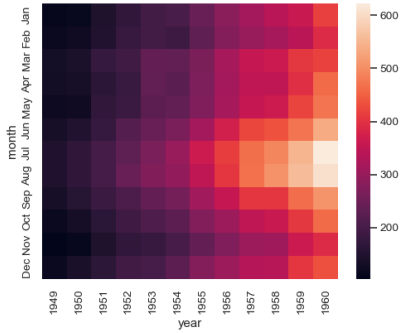
Summary

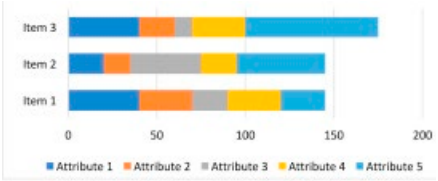
- Idioms put restrictions on tasks, so **choose carefully**
- Idioms are described with
  Data, Marks, Channels, Tasks

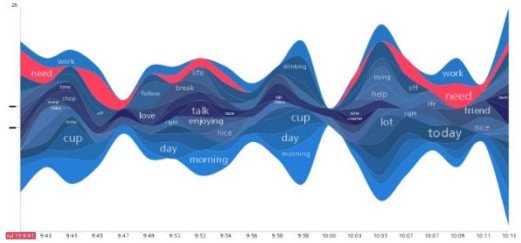
Idioms with *n* keys and 1 value

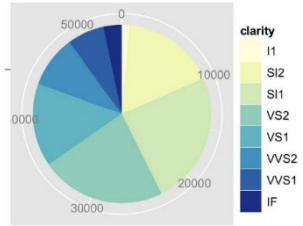












TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

Idioms and interaction

Statistical value idioms

Dr.ir. Stef van den Elzen

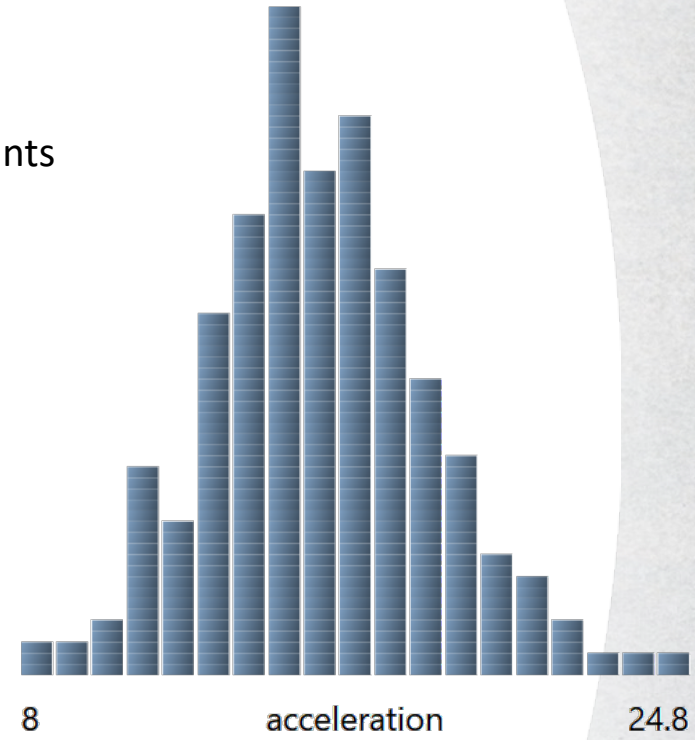
Histogram

Data:
- 1 Quantitative attribute
- **Derive data**:
  - Keys are bins, values are counts
  - Bin size is crucial

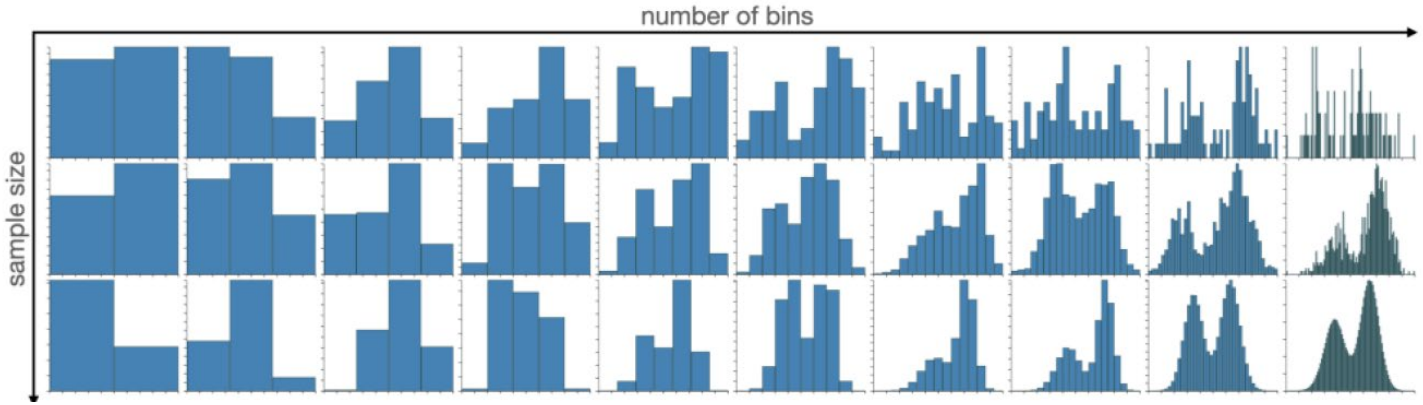
Mark:
- Line

Channels:
- Length encodes frequency

Tasks:
- Understand distribution



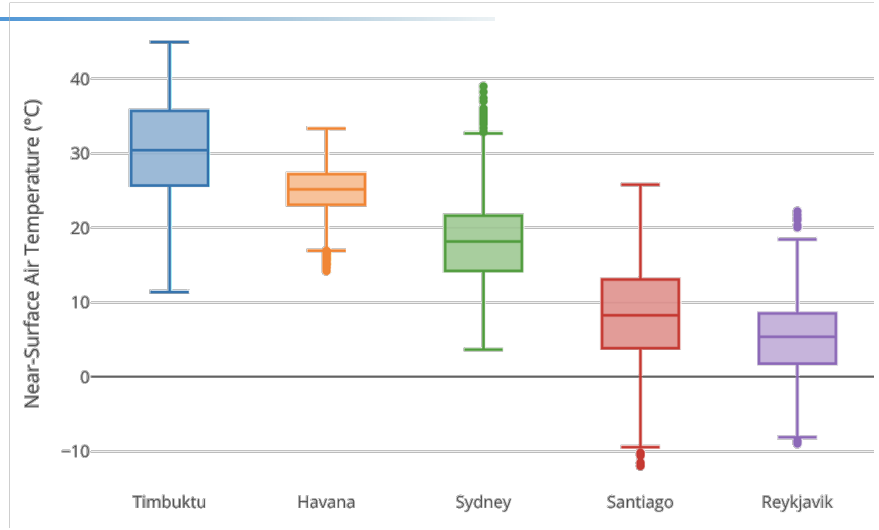
Histogram



R. Sahann, T. Muller and J. Schmidt, "Histogram binning revisited with a focus on human perception," in 2021 IEEE Visualization Conference (VIS), New Orleans, LA, USA, 2021 pp. 66-70.

Boxplot

Be aware boxplot hides details



Data:
- 1 Quantitative attribute
- **Derive data**:
  - 5 quantitative attributes
  - Median, min, max, lower + upper quartile
  - Explicitly show outliers

Mark:
- Lines (+ box)

Channels:
- Length encodes derived values

Tasks:
- Understand distribution

https://cds.climate.copernicus.eu/toolbox/doc/gallery/54_box_plots.html

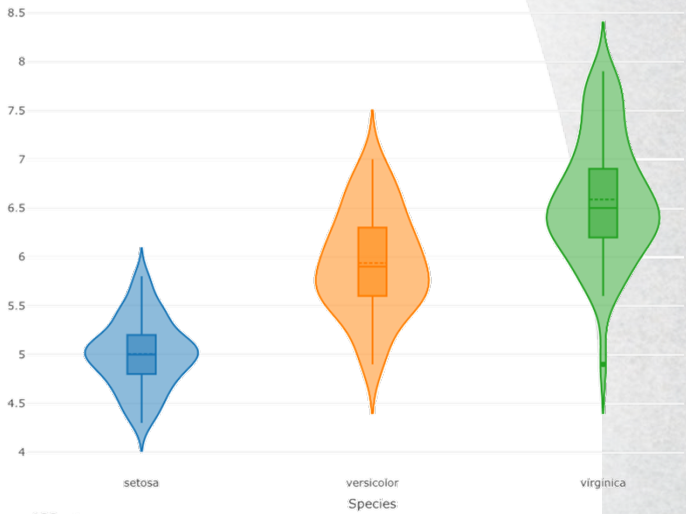
Violin plot

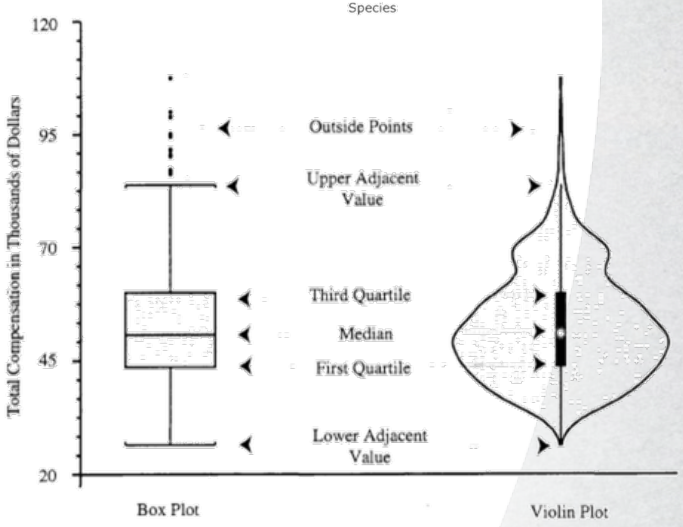
Data:
- 1 Quantitative attribute
- **Derive data**:
  - 5 quantitative attributes
  - Density at each point

Mark:
- Lines (+ box)

Channels:
- Length encodes derived values
- Width encodes frequency

Tasks:
- Understand distribution





https://towardsdatascience.com/violin-plots-explained-fb1d115e023d

Visualization

Idioms and interaction

Interaction concepts

Dr.ir. Stef van den Elzen

Analysis framework

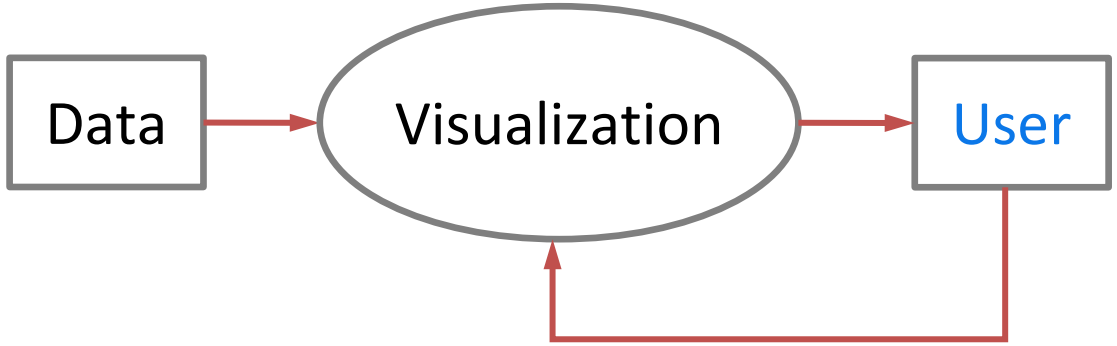
- What is shown?
  data abstraction

- Why is the user looking at it?
  task abstraction

- **How** is it shown?
  Visual encoding and interaction

Information Visualization

The use of computer-supported, ***interactive***, **visual** representations of ***abstract*** *data* to **amplify cognition** (*Card et al., 1999*)



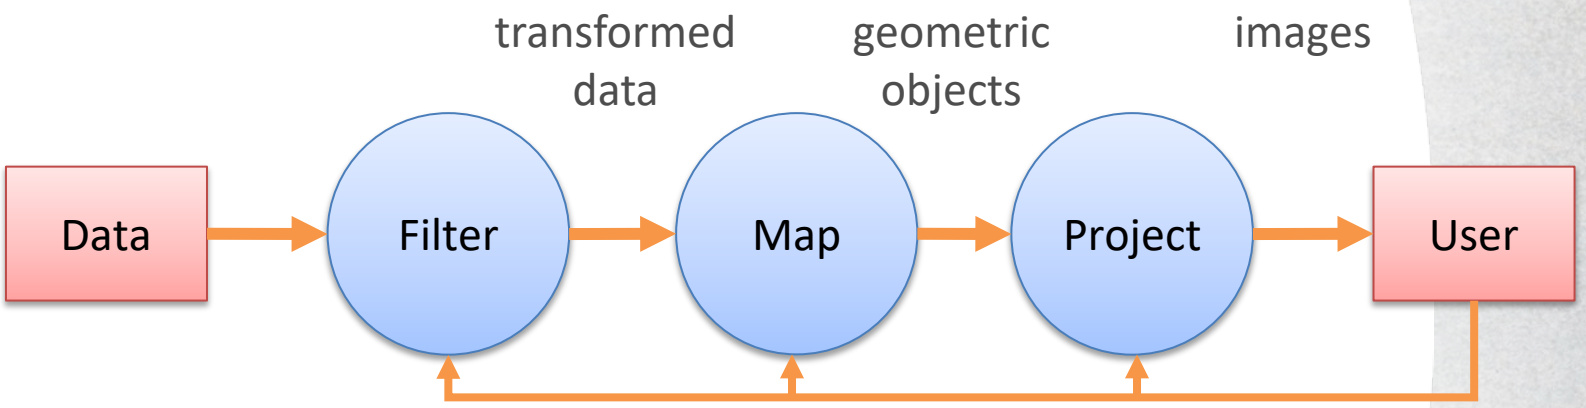
Why interaction?

- Too much data to show in one view
- Different audiences with different questions
- Increase engagement

Potential issues

- Takes time to learn
- Takes time to use
- Getting lost

Visualization pipeline



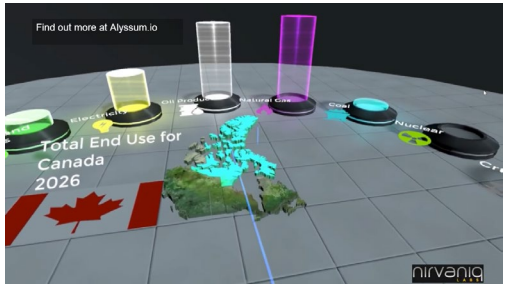
what data to show?

how to show the data?

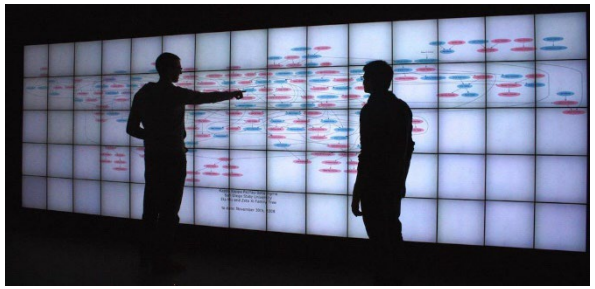
what view(s) on the data?

human computer interaction

Different modalities



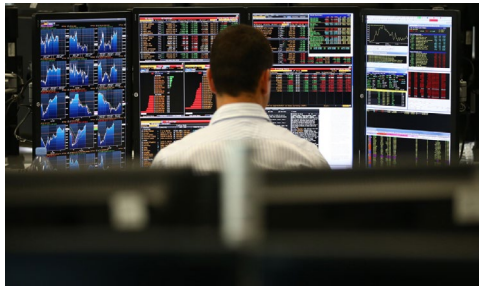
Virtual Reality



Large displays

Tabletop displays

Tablet



Many displays

Physical visualization

Interaction principles

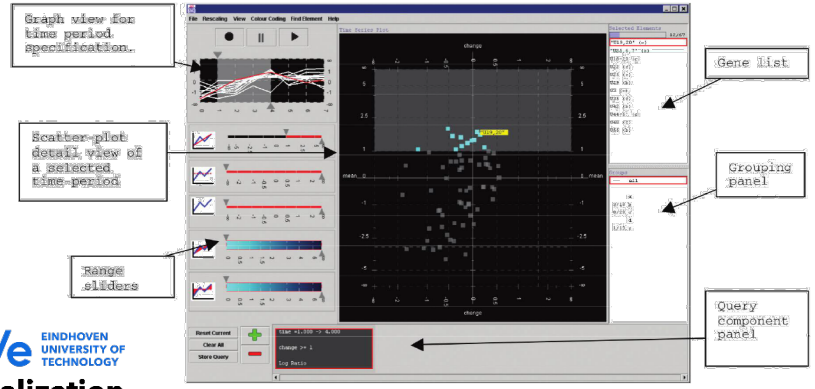
Low-latency visual feedback

- Manipulate, e.g., selection and highlighting

Time Constant	Value (in seconds)
perceptual processing	0.1
immediate response	1
brief tasks	10

[Card et al. 91, Table 3].

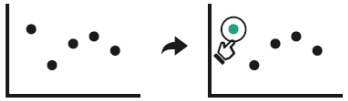
Overview first, Zoom and Filter, Details on Demand – Visual Information-Seeking Mantra, Shneidermann 1996.



Manipulate

- Change over Time

- Select



- Navigate
  - Item Reduction
    - *Zoom*
      Geometric or *Semantic*

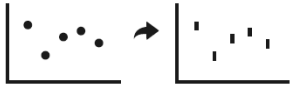
    - *Pan/Translate*

    - *Constrained*

  - Attribute Reduction
    - *Slice*

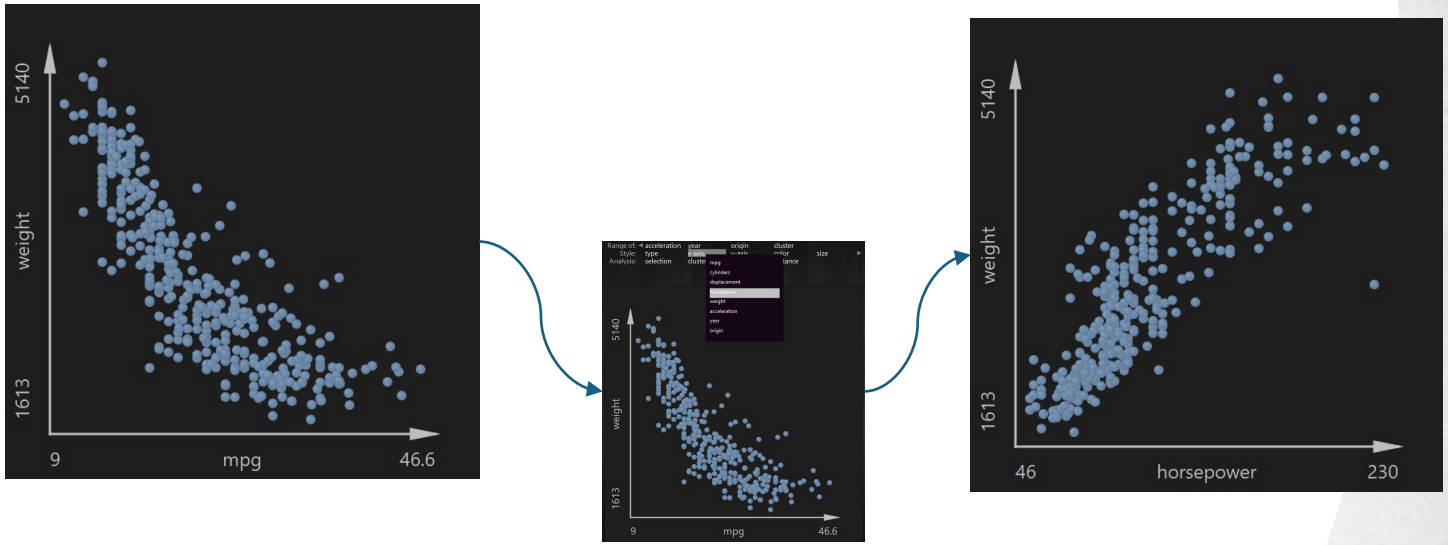
    - *Cut*

    - *Project*



Interaction: change over time

- Advantage of digital over paper
  - Change encoding, parameters, viewpoint, aggregation, …
- Within encoding
  - Change sorting order, rearrange layout, …
- Consider animation

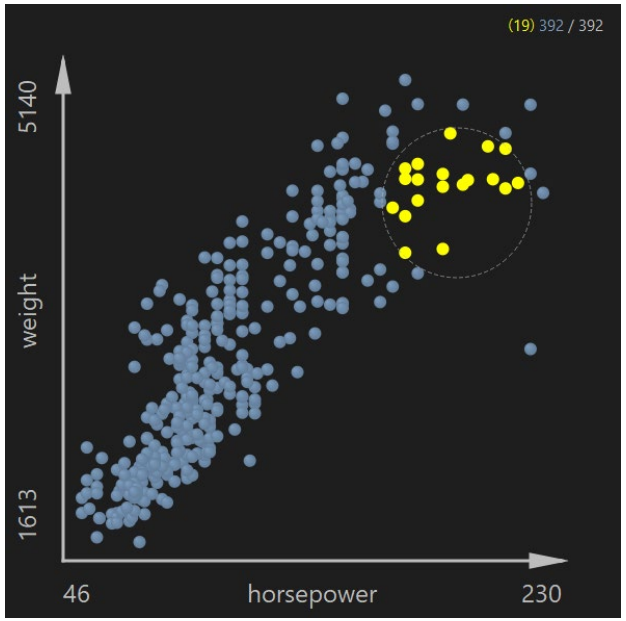


Interaction: change x-axis attribute

Change over Time

Interaction: select

- Basic operation for all interaction
- Design choice: click vs. hover
- Highlight: change visual encoding for items of interest
  - Color
  - Border
  - Explicitly link items
  - …



Select

Interaction: navigate

- Item reduction

➔ *Zoom*
Geometric or *Semantic*

- Change viewpoint / visibility of items
- Camera metaphor
  (zoom, translate, rotate)
- Geometric – camera
- Semantic – change visual encoding depending on zoom-level

Interaction: navigate

- Item reduction

https://www.youtube.com/watch?v=XipH0S7cj9w

Interaction: navigate

- Item reduction

➔ *Pan/Translate*

Camera metaphor
(zoom, translate, rotate)

➔ *Constrained*

Constrain camera to specified area

Interaction: navigate

- Item & attribute reduction

→ *Slice*

Show only items matching specific value for given attribute

→ *Cut*

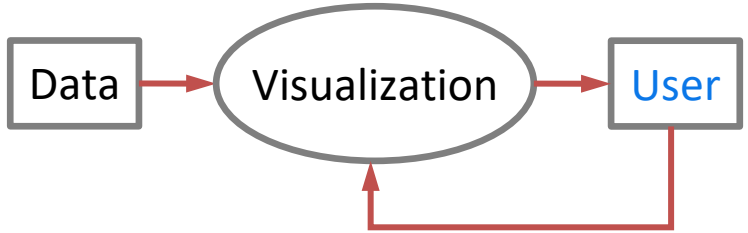
Show only items within some region or attribute range

→ *Project*

Dimensionality reduction (e.g., 3D → 2D)

Summary

- Interaction to
  - Reduce data
  - Show different perspectives
  - Support different users
- Interaction needs low latency
- Many design decisions involved, choose carefully
  e.g., based on the data and task abstraction



TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

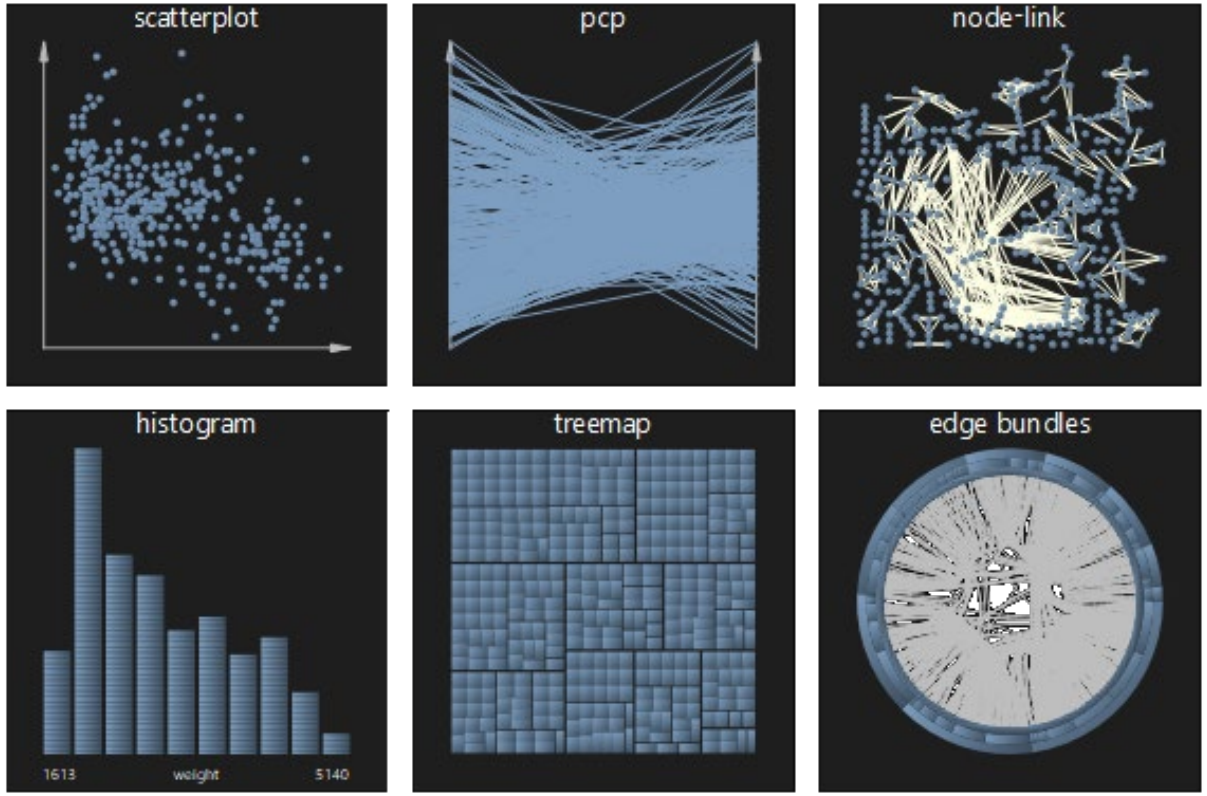
Visualization

Idioms and interaction

Multiple view concepts

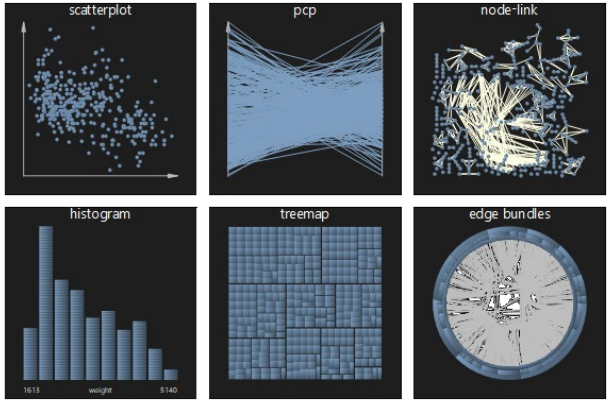
Dr.ir. Stef van den Elzen

Coordinated multiple views



Different visual encodings of same data

Coordinated multiple views



Different visual encodings of same data

- Show relations between items and attributes
- Provide different perspective on same items

Design choices

- View count: few vs. many
- View visibility: popup vs. side-by-side
- View arrangement: manual vs. automatic

Linking & brushing

- Linked view parameters
- Linked highlight / selection – items highlight/selected in one view are also selected in the other views.

https://twitter.com/fabiofranchino

Coordinated multiple views

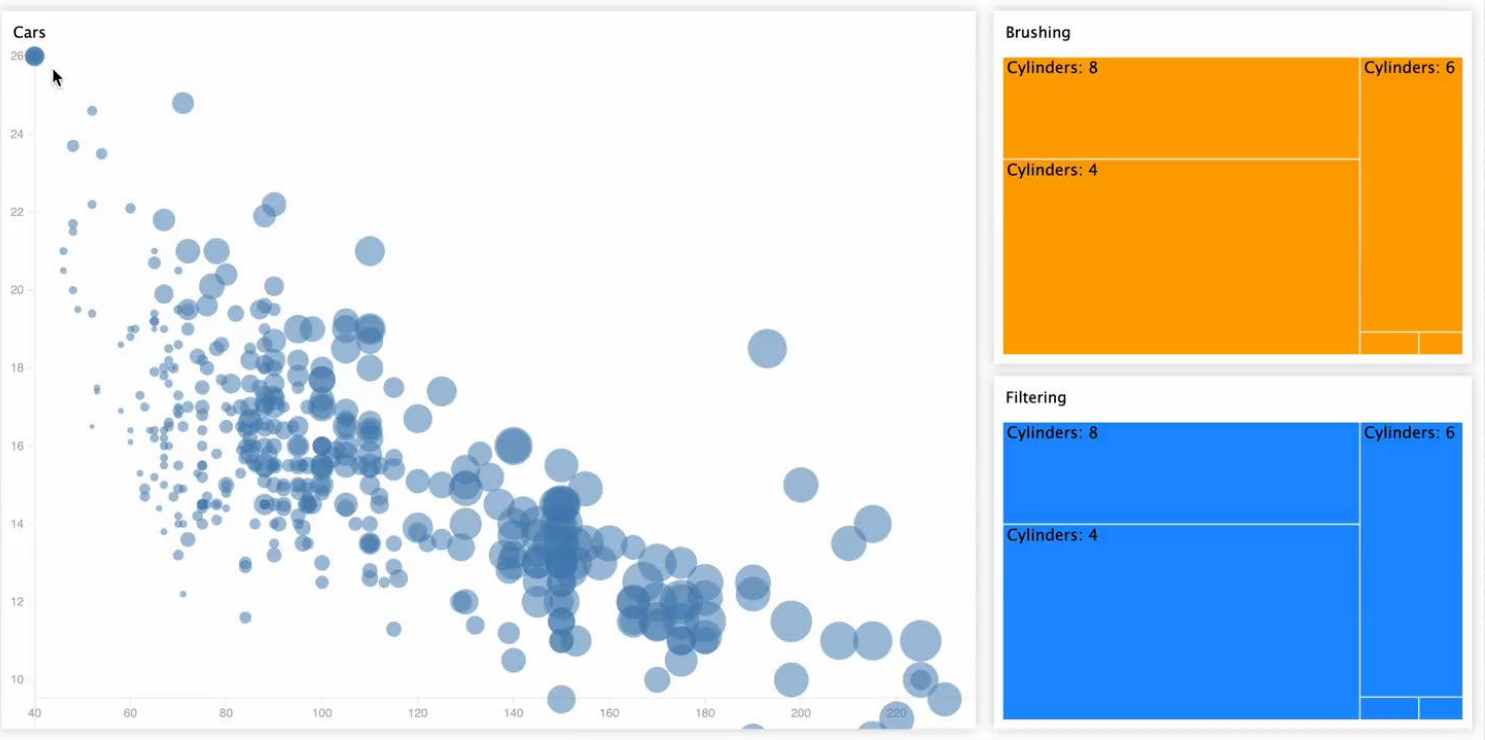
Brushing vs. filtering

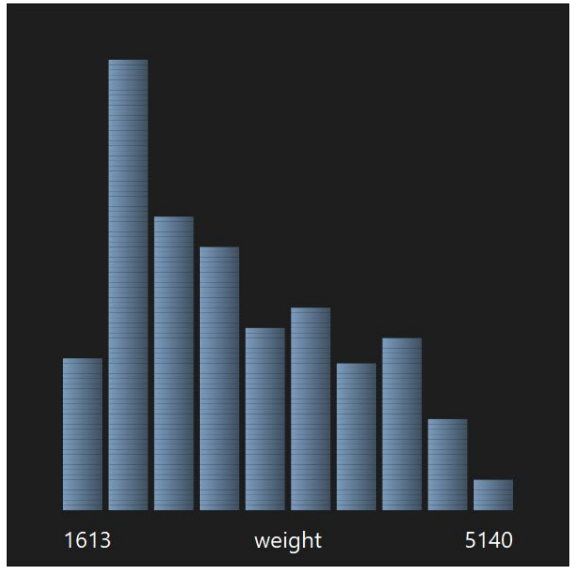


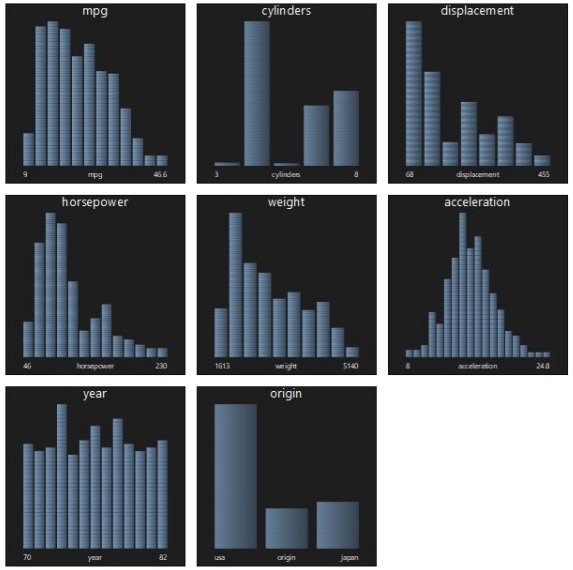
Coordinated multiple views

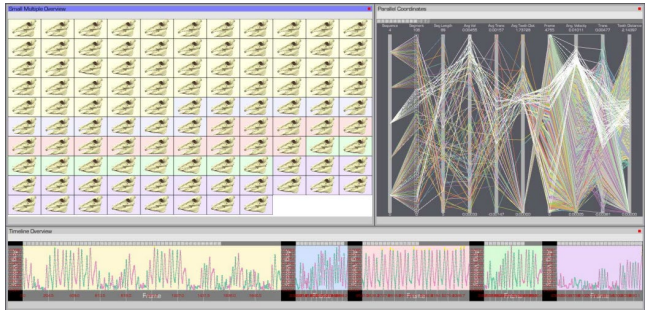
Types of multiple views

Multiple views: different visual encodings of same data.

Small multiples: same representations of data, changing for one attribute.







Keefe, D. et al., 2009. Interactive coordinated multiple-view visualization of biomechanical motion data. *IEEE transactions on visualization and computer graphics*, 15(6), 1383-90.

Coordinated multiple views

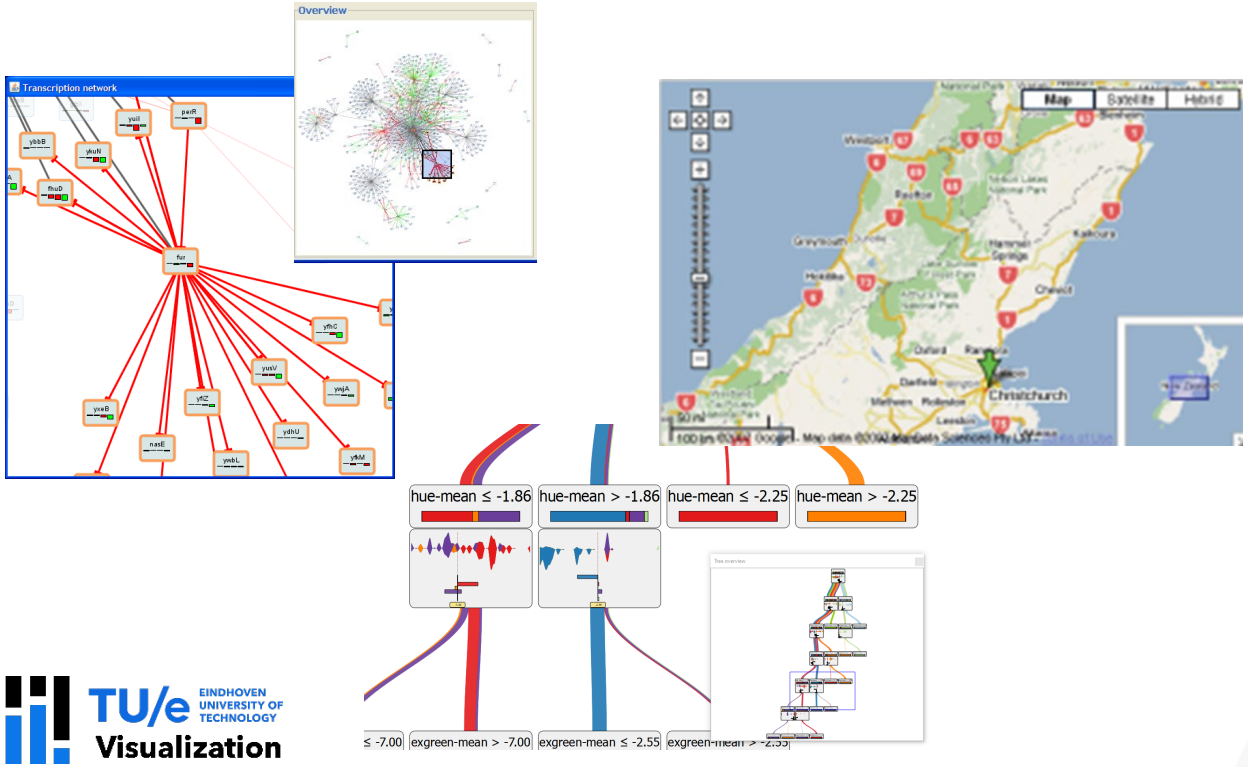
Types of multiple views

Multiple views: different visual encodings of same data.

Small multiples: same representations of data, changing for one attribute.

Overview & detail:

- Same visual encoding, same data, different zoom-level
- Detail on demand: extra view with more info on selection



Interaction Coordinated Multiple Views

- Share Encoding: Same/Different
  - *Linked Highlighting*

- Share Data: All/Subset/None

- Share Navigation

Focus+Context visualization

Different levels of detail integrated in the same view

- Show area/items of interest (focus) in detail and surroundings (context) in less detail
- Distortion techniques

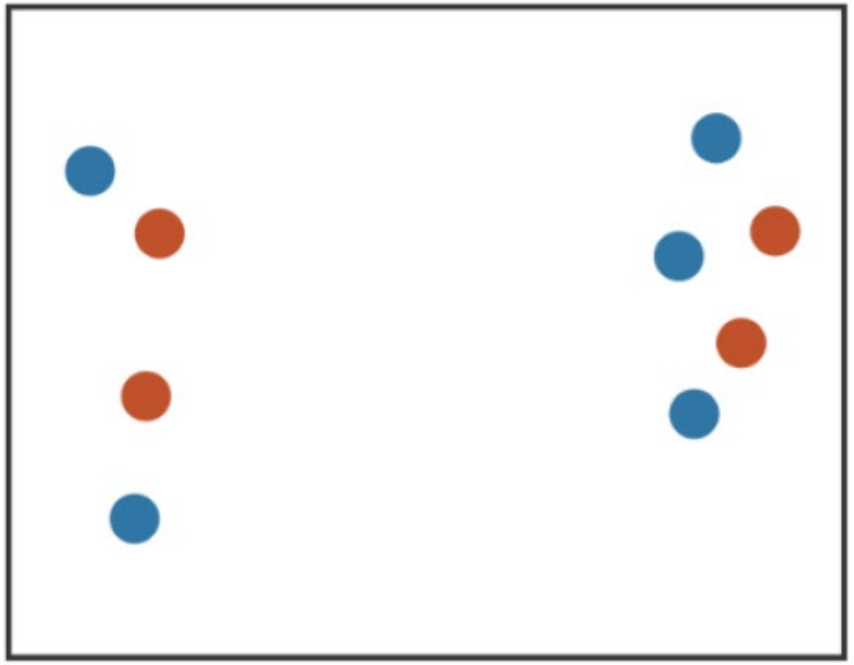
Module 4 – Lecture Questions

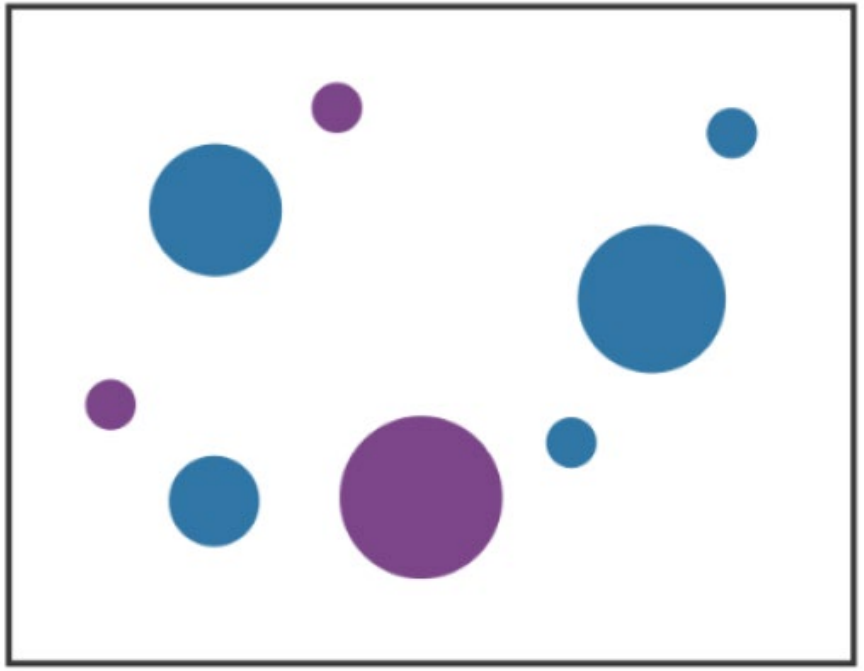
Dr. ir. Stef van den Elzen

Questions submitted

- What is meant by visual encodings being seperable or interfering?



Position + Color → seperable



Size + Color → interfere

Questions submitted

- I don't understand the difference between slicing and cutting.

Filter

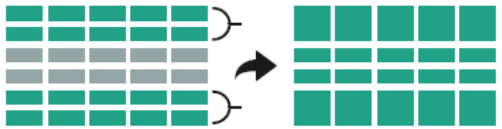
→ Items

→ Attributes

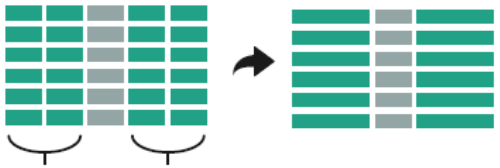
- Straightforward / intuitive
- But: out of sight, out of mind

Aggregate

→ Items



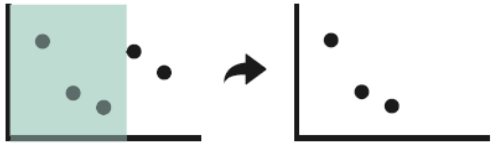
→ Attributes



- Summarize dataset
- But: details are lost

→ *Slice*

→ *Cut*



→ *Project*

Questions submitted

- I am really not sure about what exactly multi-dimensional data is.

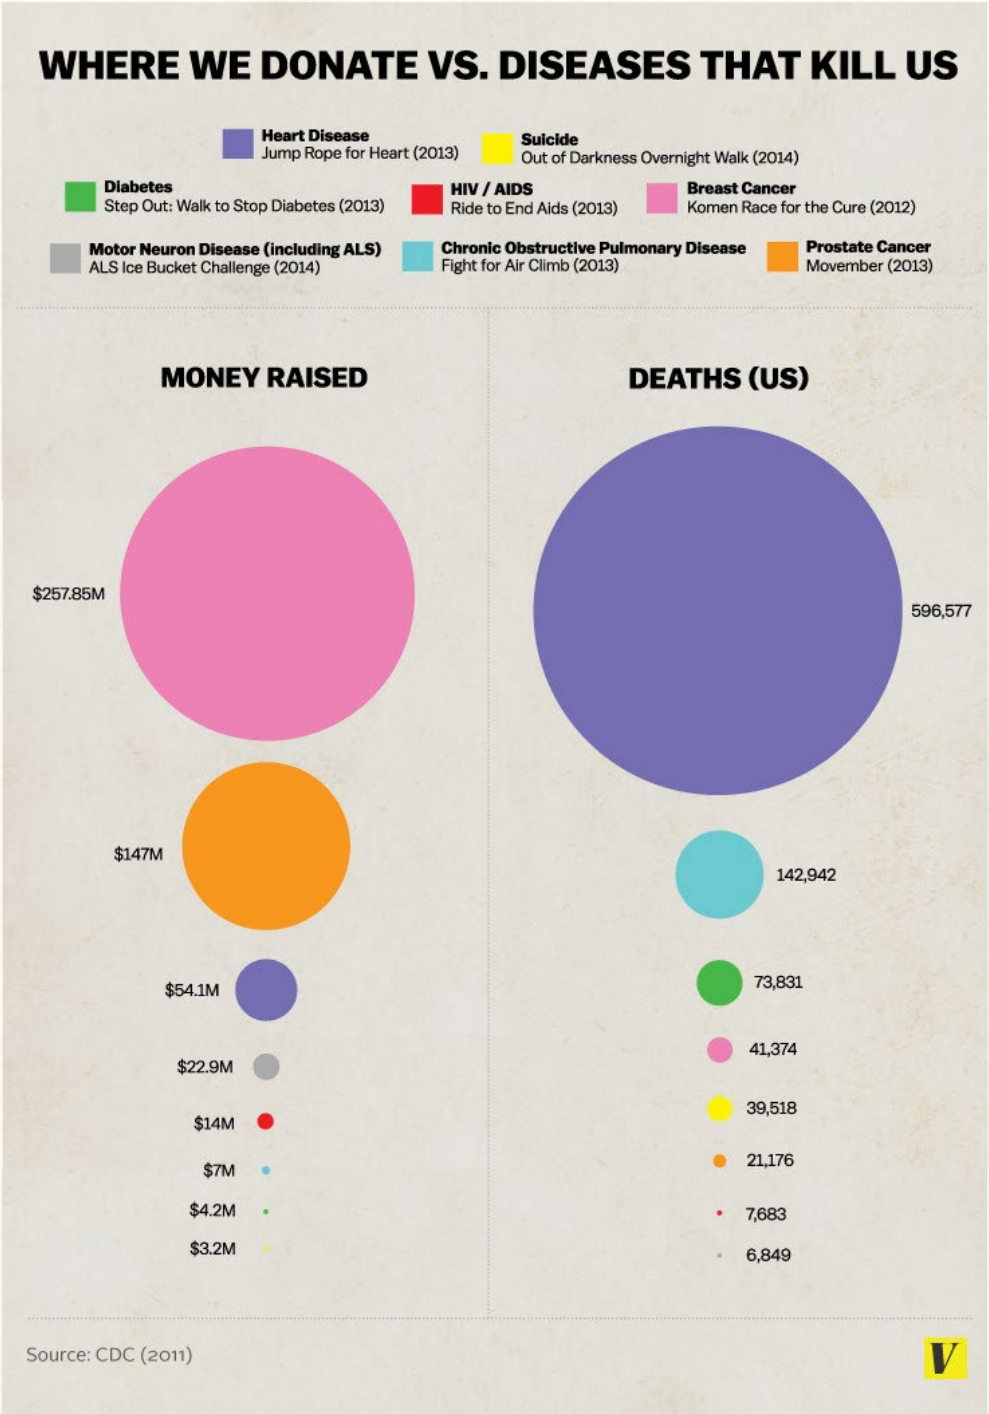
Module 4 – Discussion on Good and Bad Visualizations

Dr. ir. Stef van den Elzen

Good and Bad Visualizations

1. **Name one of the elements in the visualization shown to the right that should be considered wrong or inadequate by visualization standards?**

2. **What would you suggest as an improved visualization?**

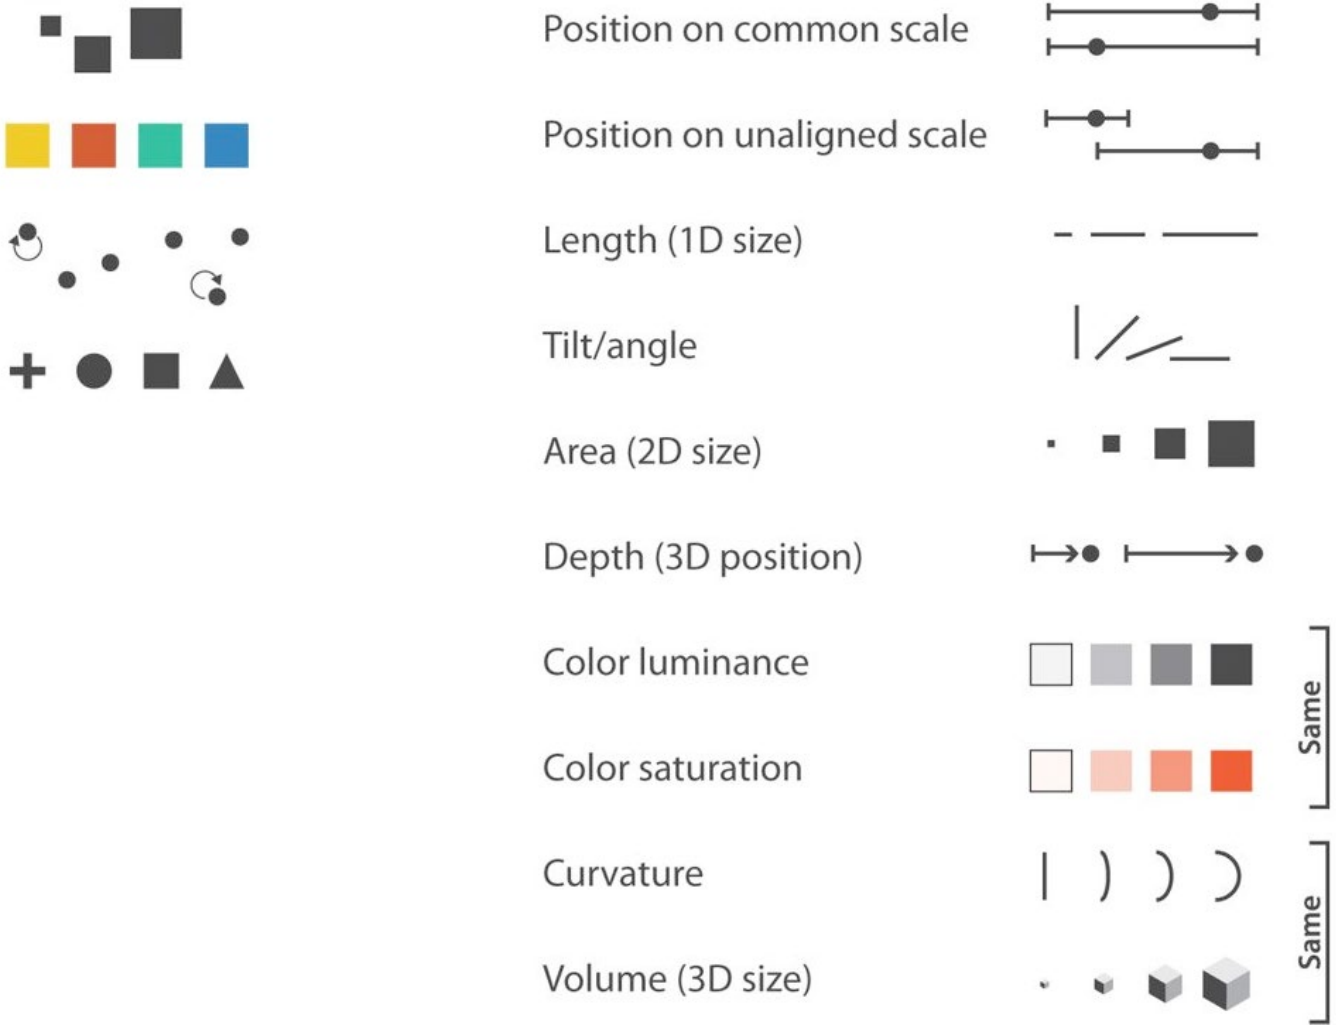


Scaling to radius or area?

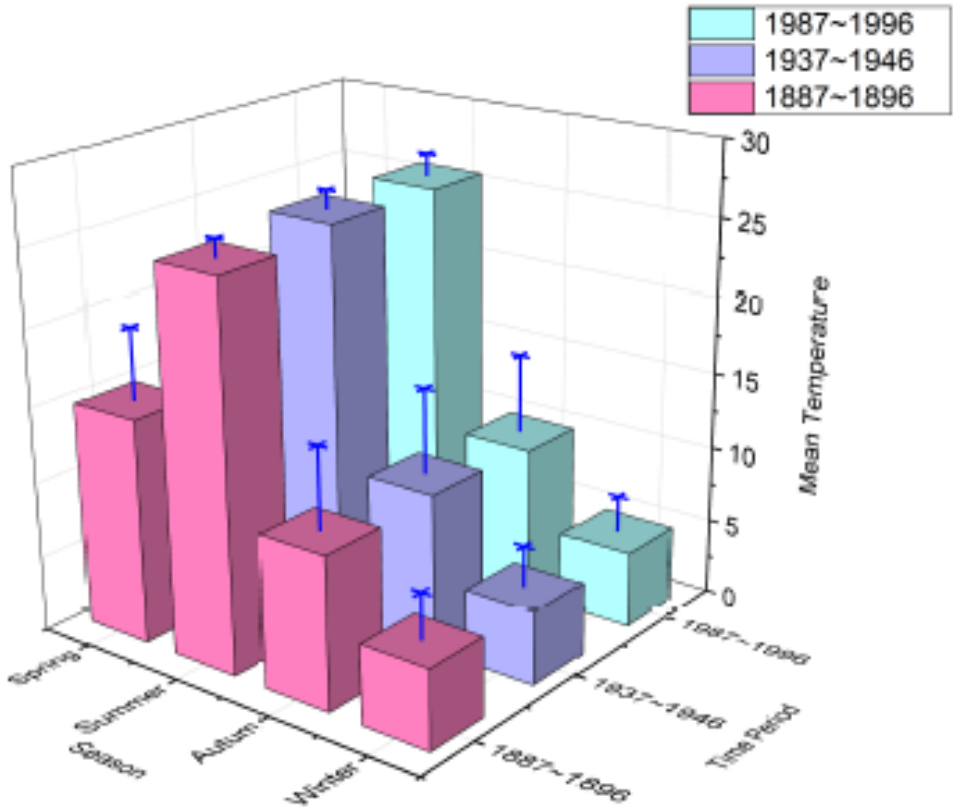
The 2011 State of the Union Address
https://www.youtube.com/watch?v=kl2g40GoRxg

Visual Channel Rankings (Munzner's)

Categorical	Ordered
Spatial region	Position on common scale
Color hue	Position on unaligned scale
Motion	Length (1D size)
Shape	Tilt/angle
	Area (2D size)
	Depth (3D position)
	Color luminance (Same)
	Color saturation (Same)
	Curvature (Same)
	Volume (3D size) (Same)

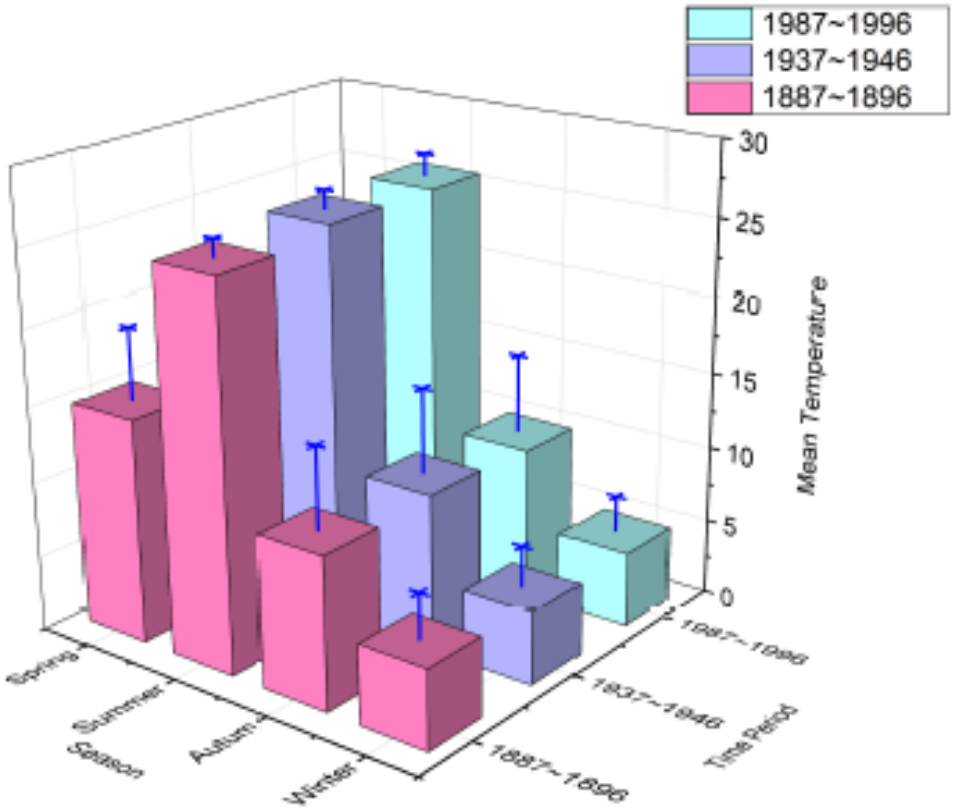


Good and Bad Visualizations



- Assuming this is tabular data, how many attributes are encoded in this visualization? Which data types are they (categorical, ordinal, or quantitative)?

Good and Bad Visualizations



- Assuming this is tabular data, how many attributes are encoded in this visualization? Which data types are they (categorical, ordinal, or quantitative)?

  Temperature – quantitative (sequential)

  Time period – ordinal/quantitative (sequential)

  Season – ordered (cyclic)
- Name two elements on the visual encoding choices (marks/visual channels) that can be considered wrong or inadequate ? Motivate each choice in one sentence.

- Which visual encoding would you use? Motivate each choice in one sentence.

- Navigate
  - Item Reduction
    - *Zoom*
      Geometric or *Semantic*

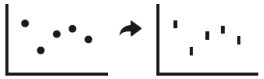
    - *Pan/Translate*

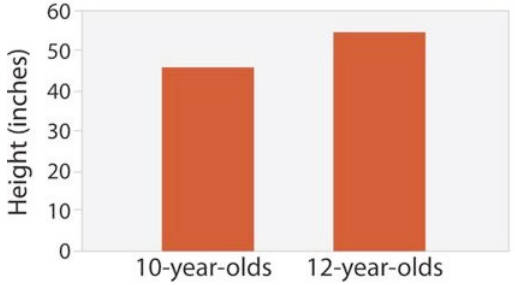
    - *Constrained*

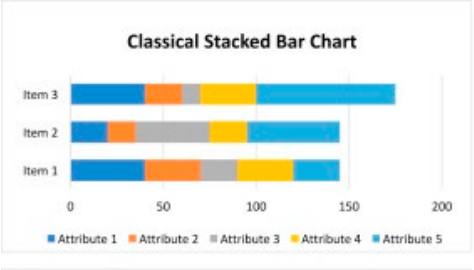
  - Attribute Reduction
    - *Slice*

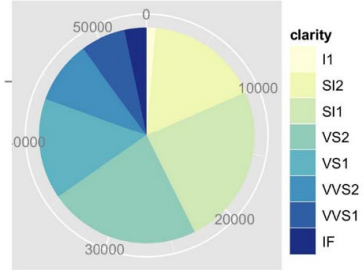
    - *Cut*

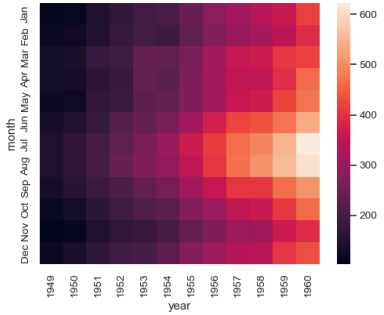
    - *Project*

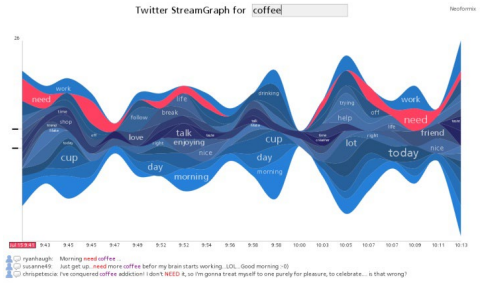






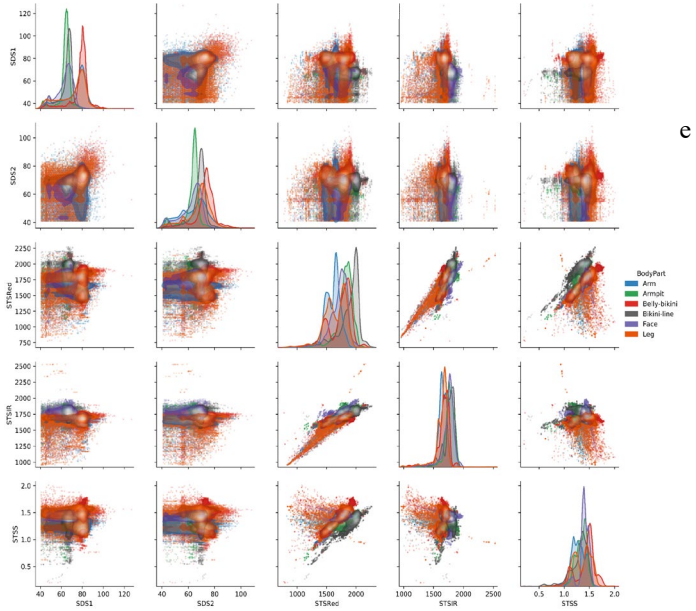


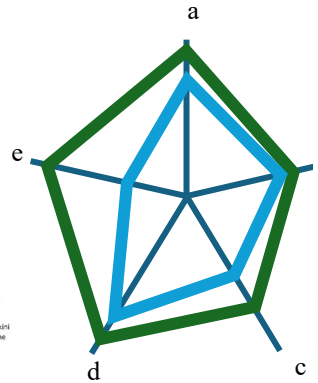


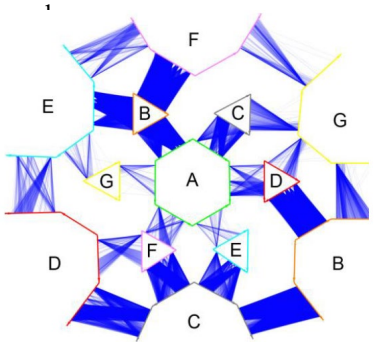


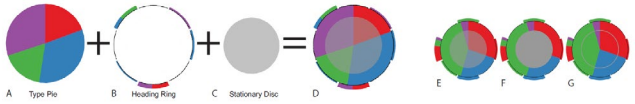
Multivariate Idioms

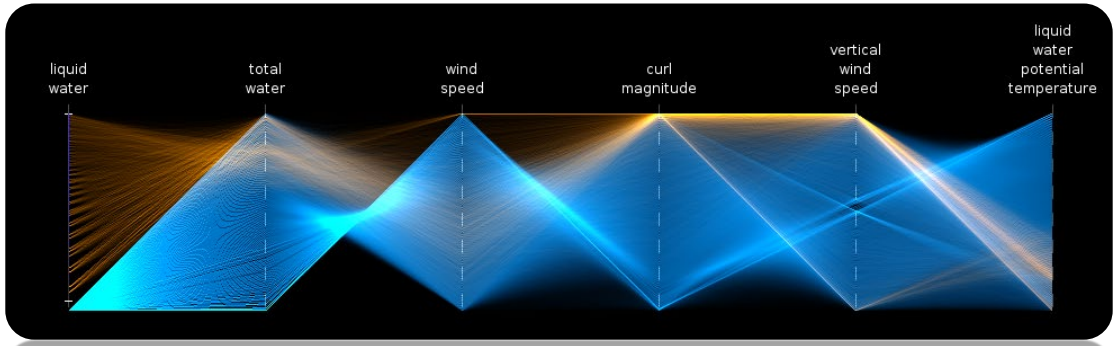
Visualization Idioms for Multivariate data











Scatterplots

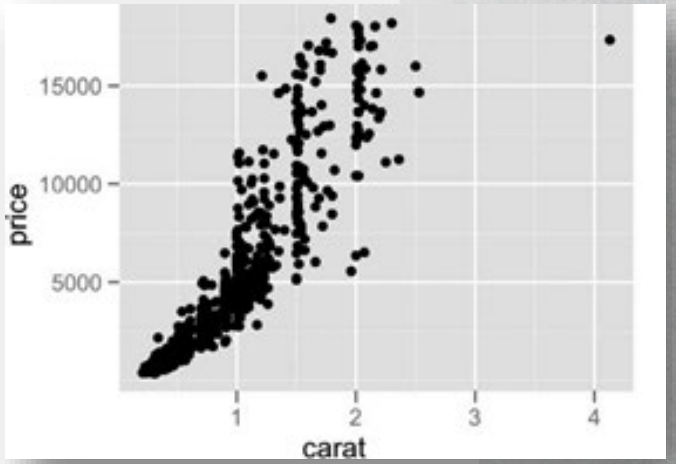
Data:
- 2 Quantitative attributes
- No keys, only attribute values

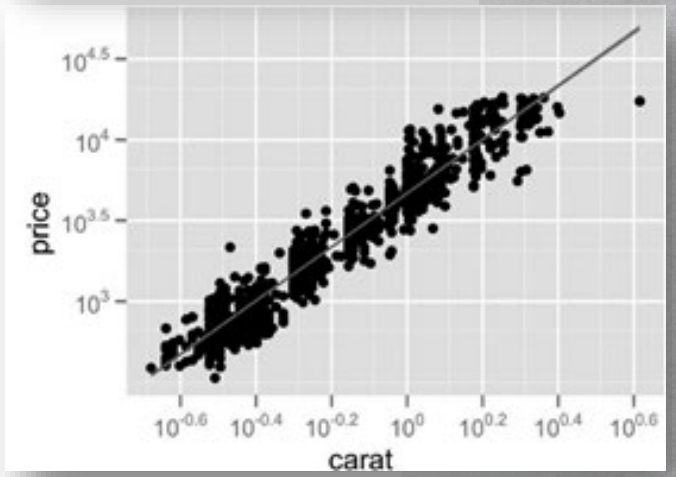
Mark:
- Points

Channels:
- Horizontal + vertical position

Tasks:
- Find trends, outliers, distribution, correlation, clusters

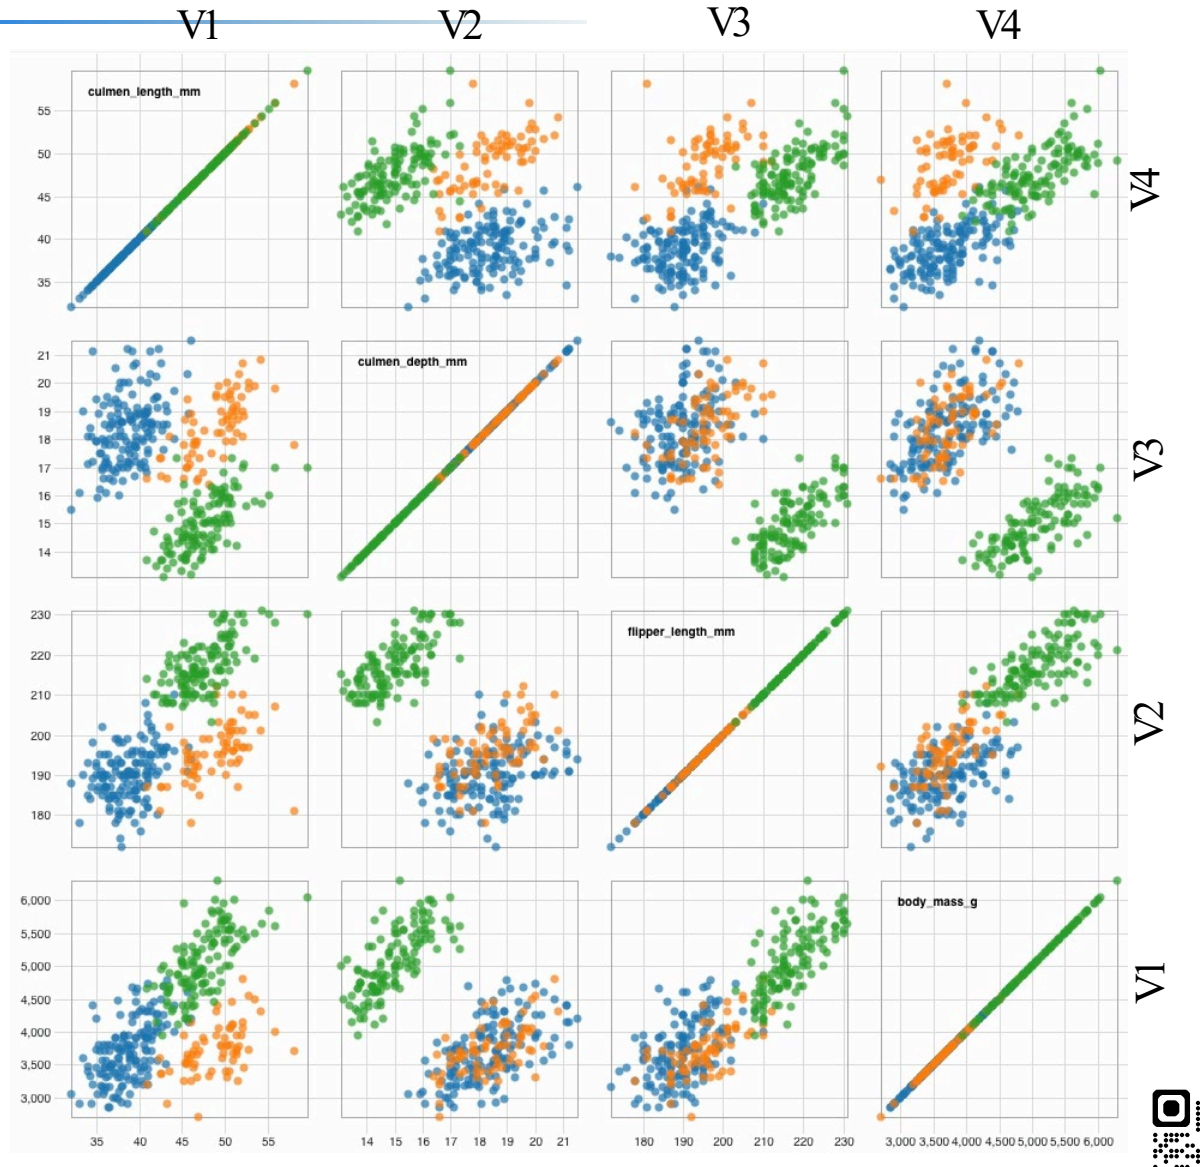
Scalability? → Hundreds of items



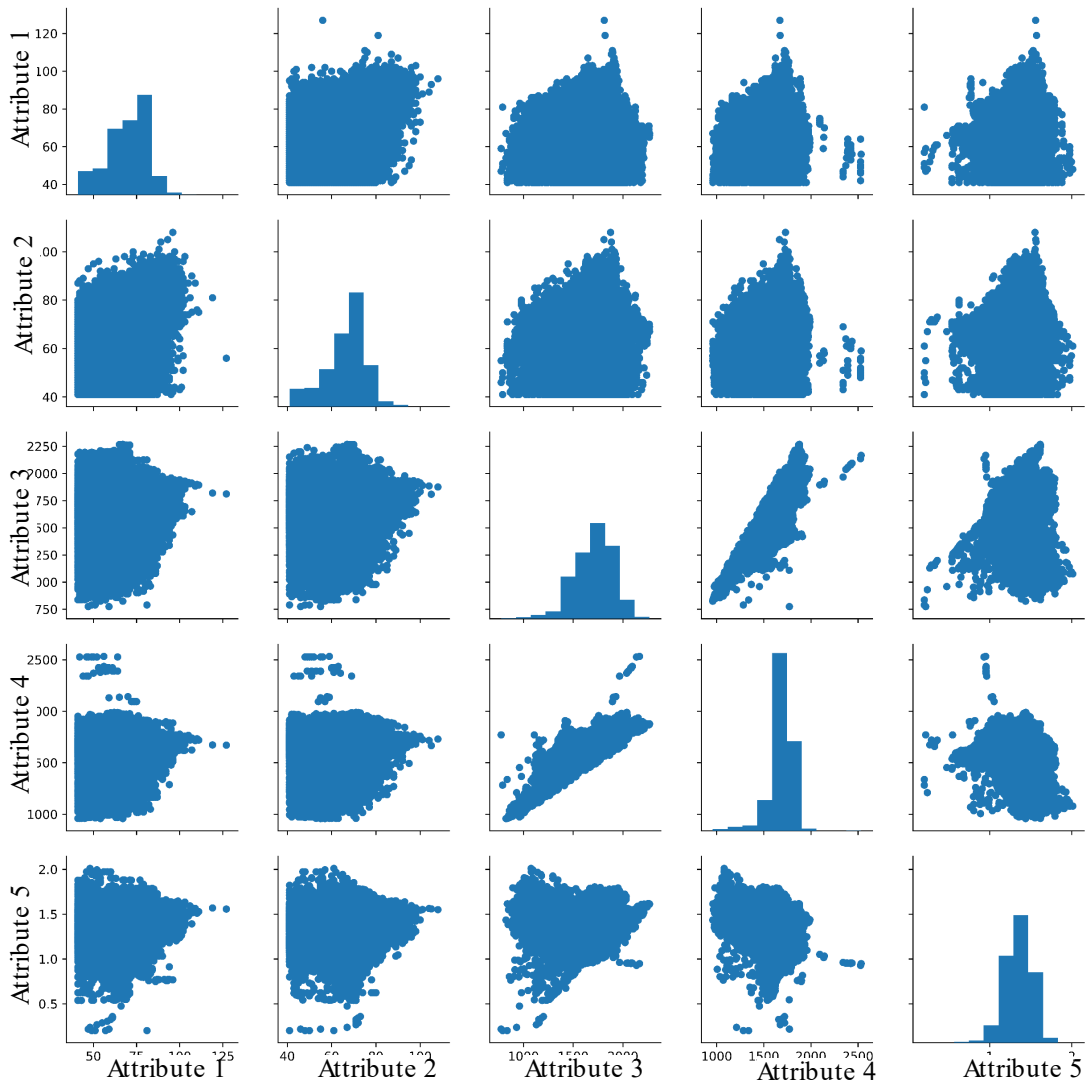


[A layered grammar of graphics. Wickham. Journ. Computational and Graphical Statistics 19:1 (2010), 3–28.]

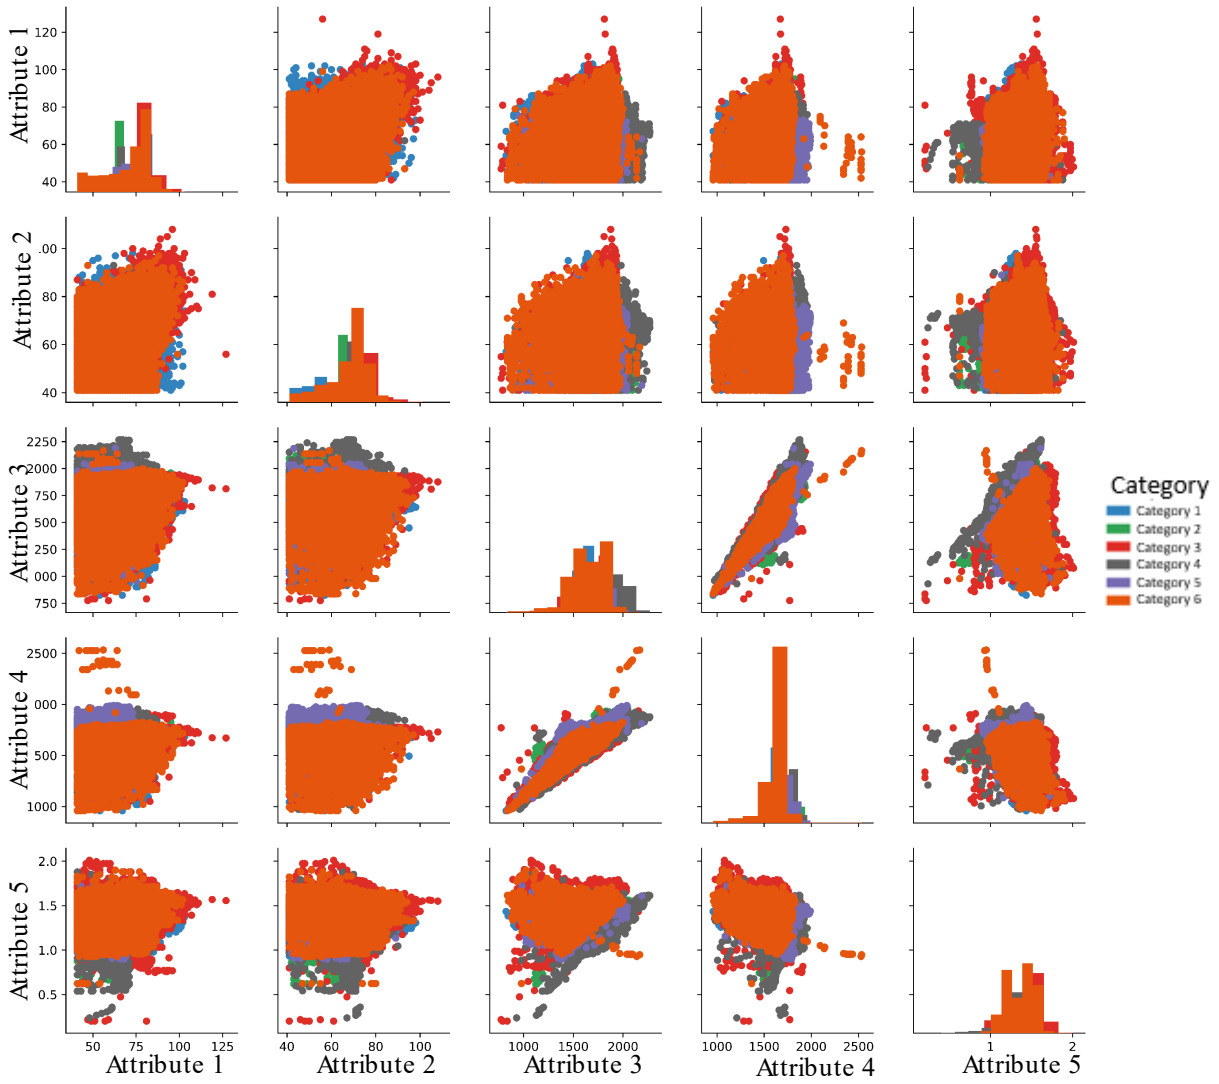
Scatterplot Matrix (SPLOM)



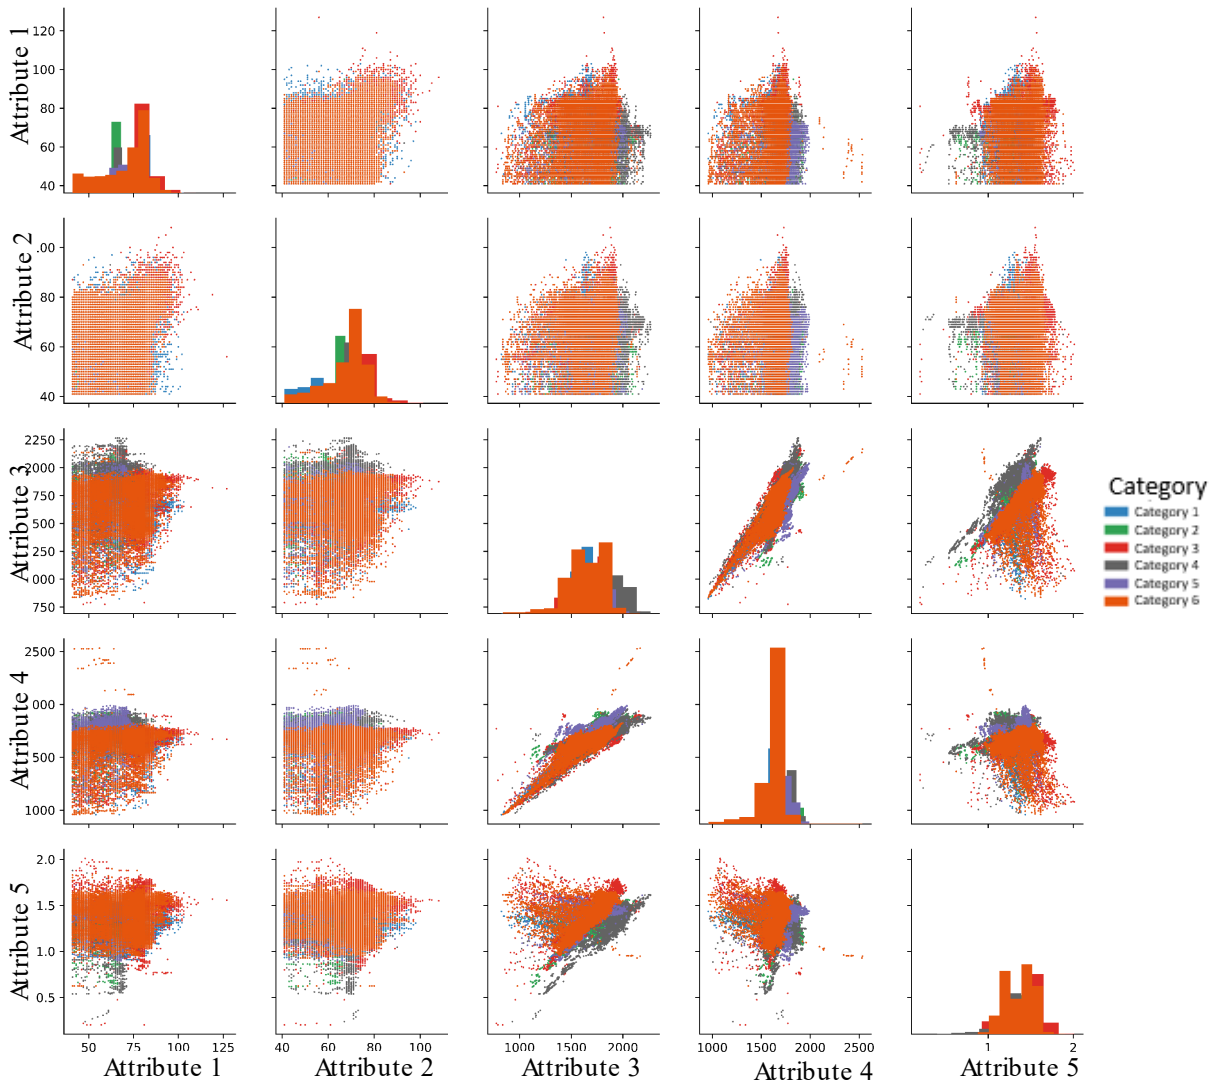
SPLOM Scalability



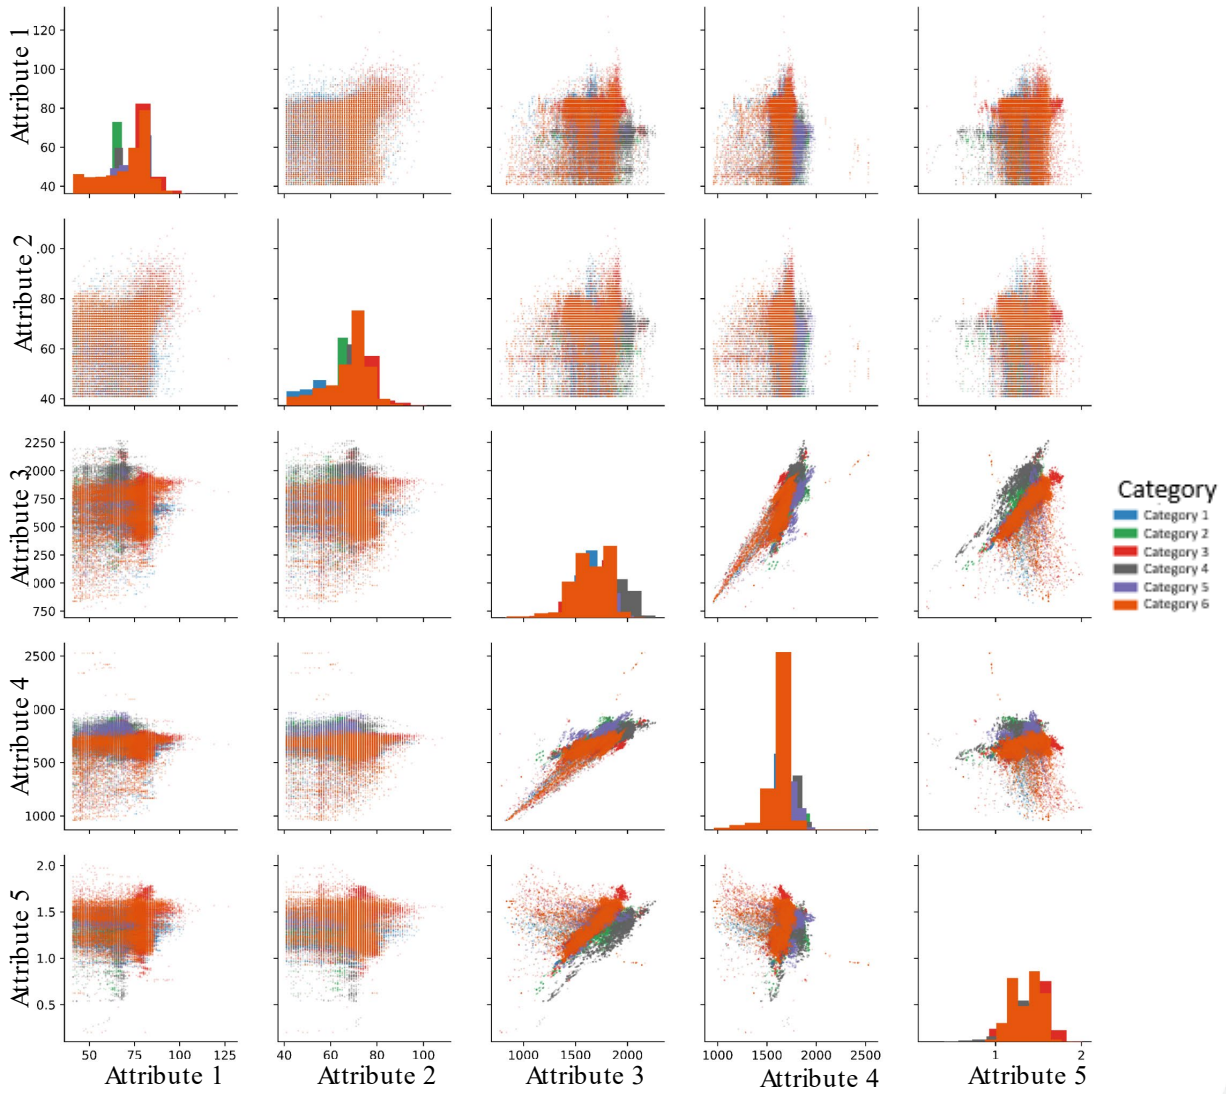
SPLOM Scalability



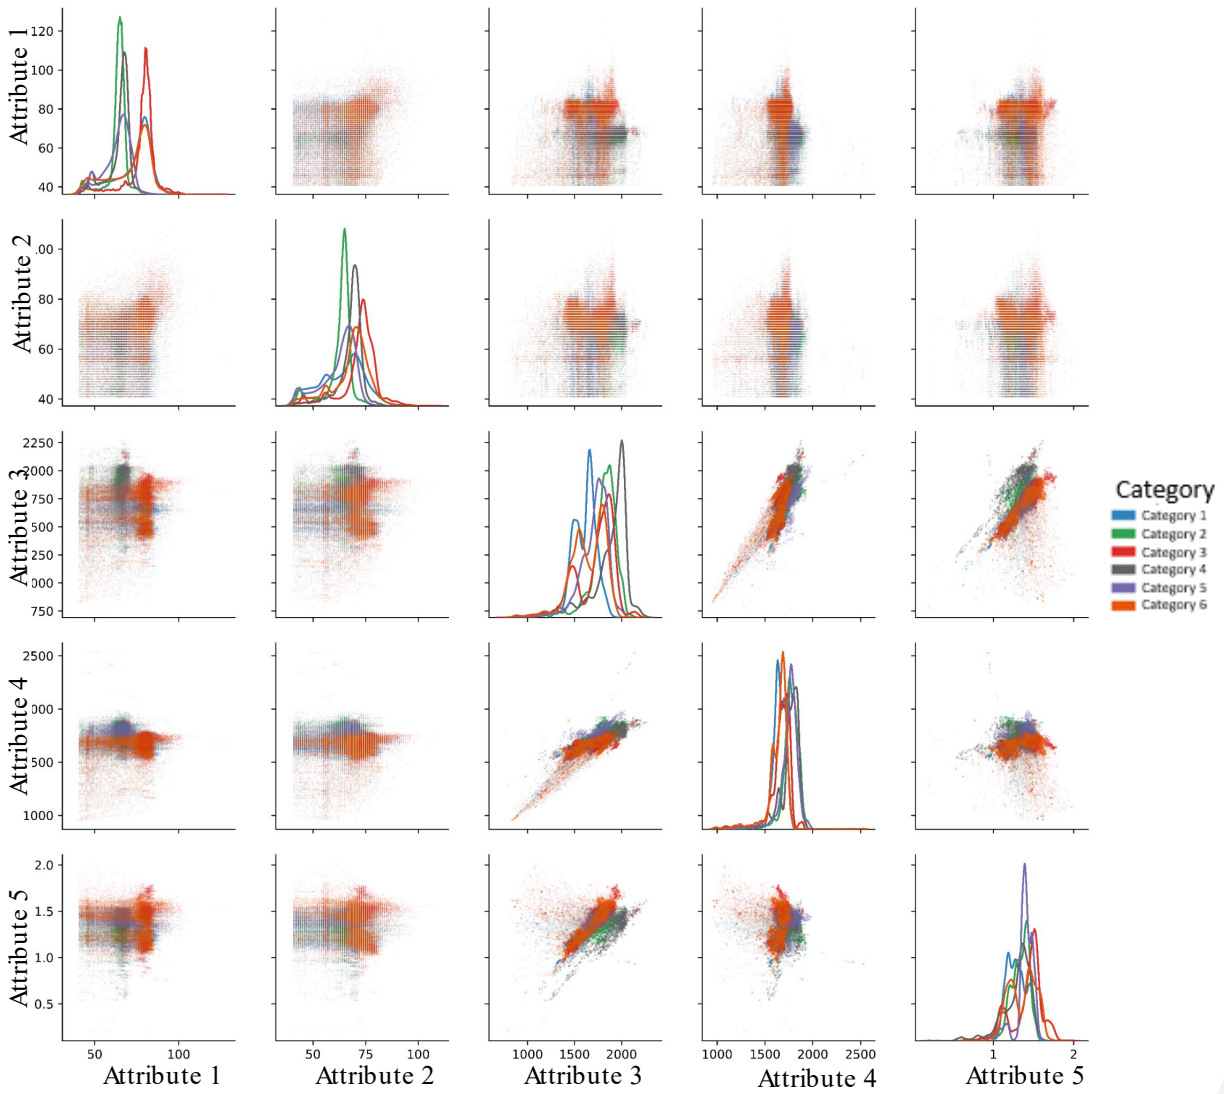
SPLOM Scalability



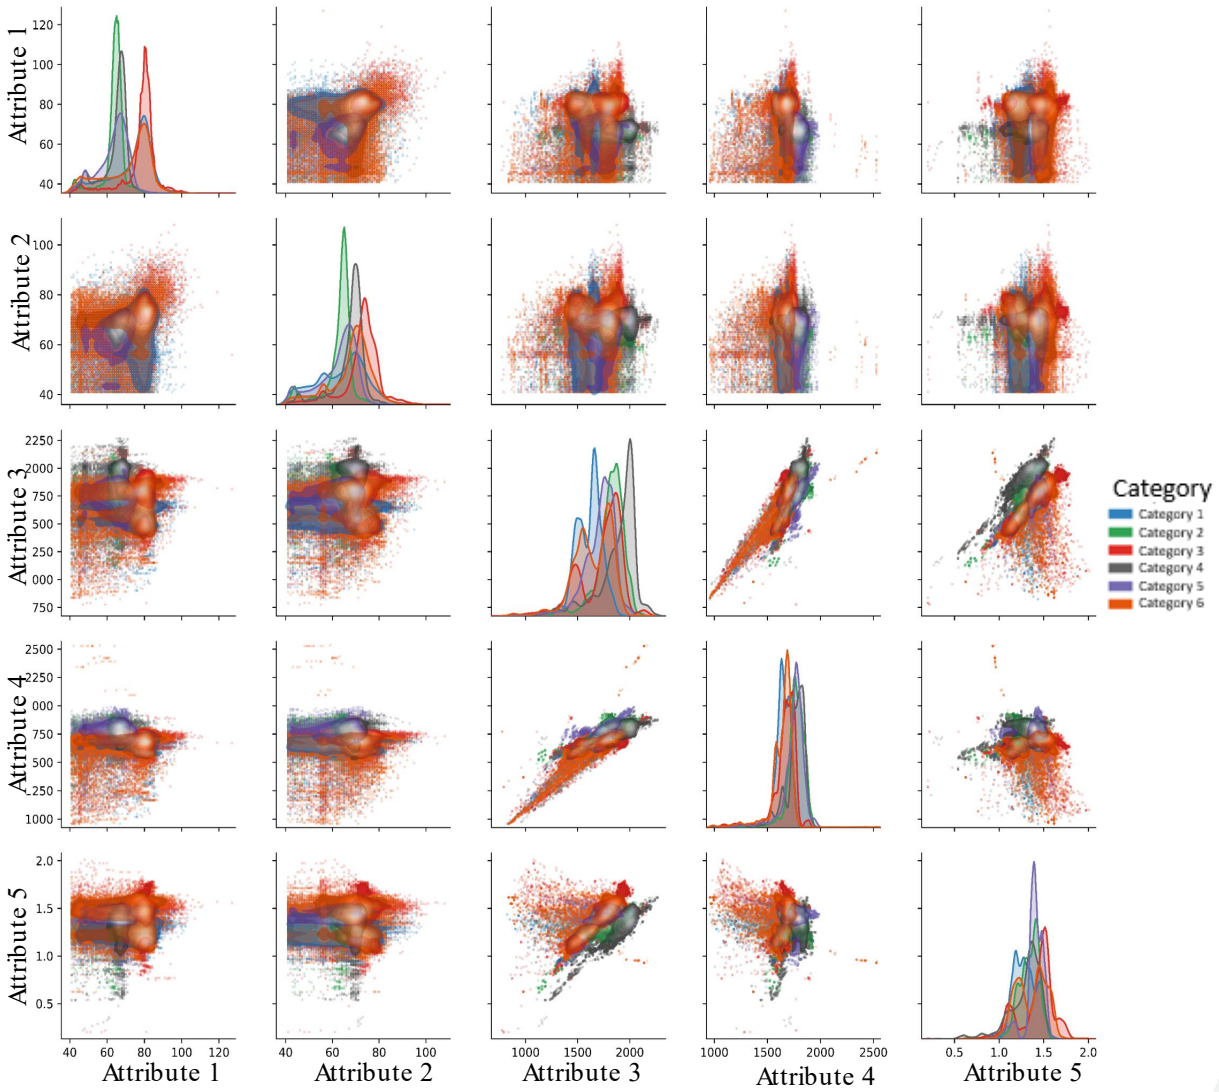
SPLOM Scalability



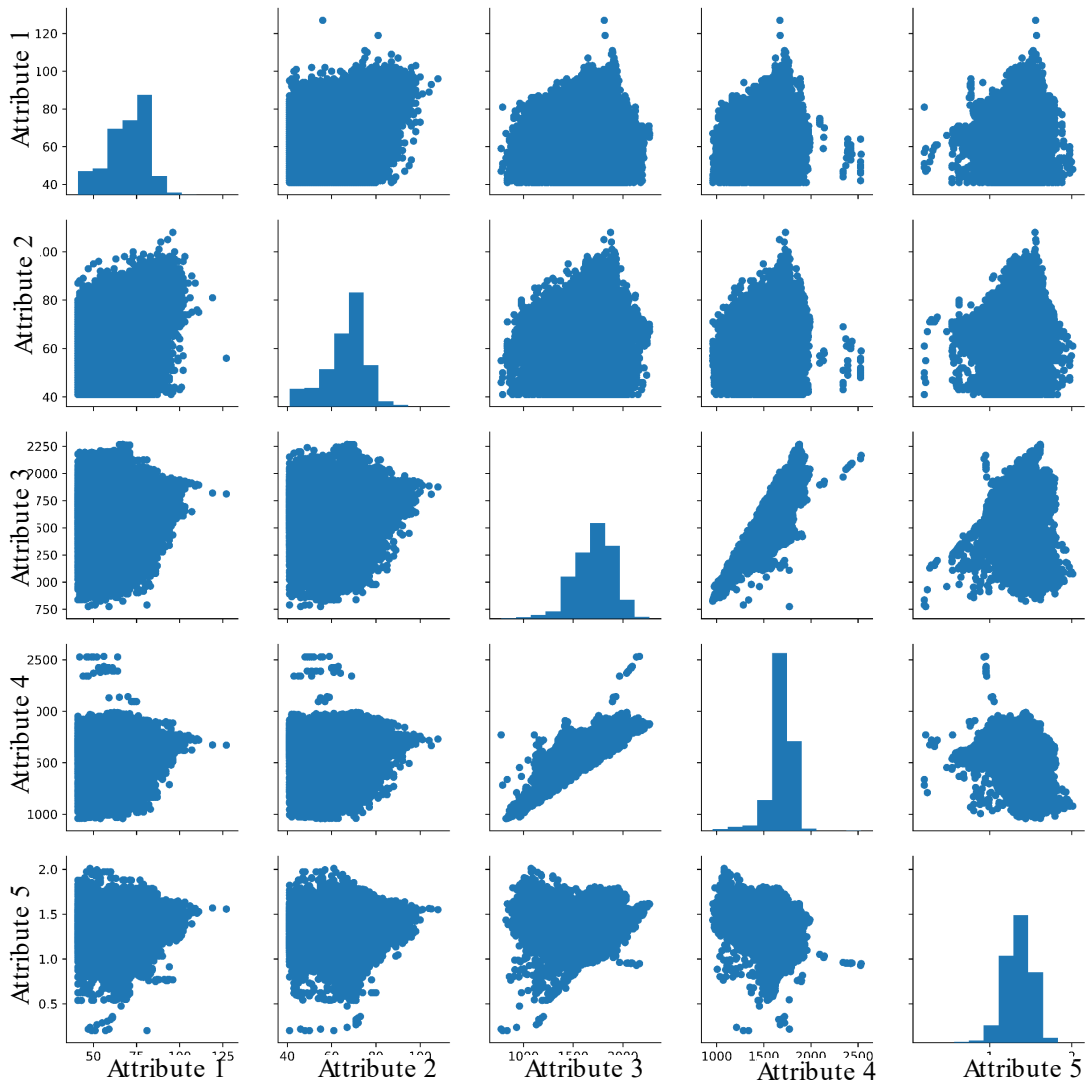
SPLOM Scalability



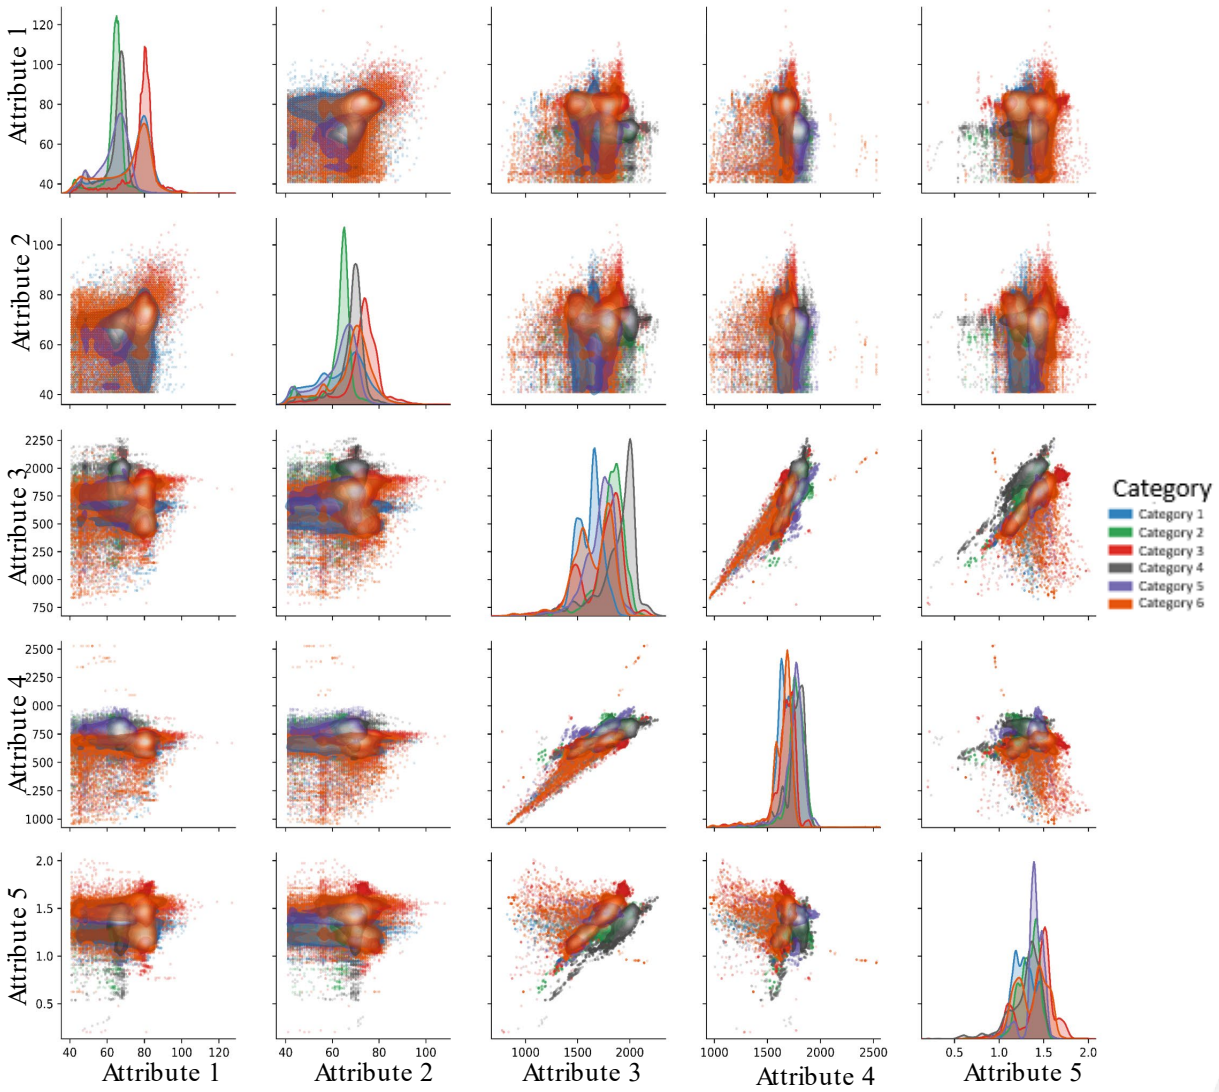
SPLOM Scalability



SPLOM Scalability

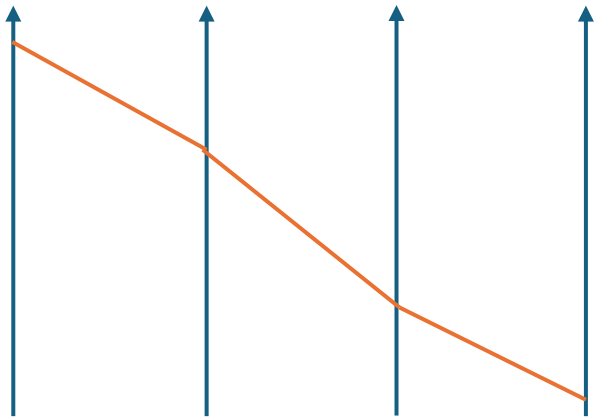


SPLOM Scalability



Parallel Coordinate Plots (PCPs)

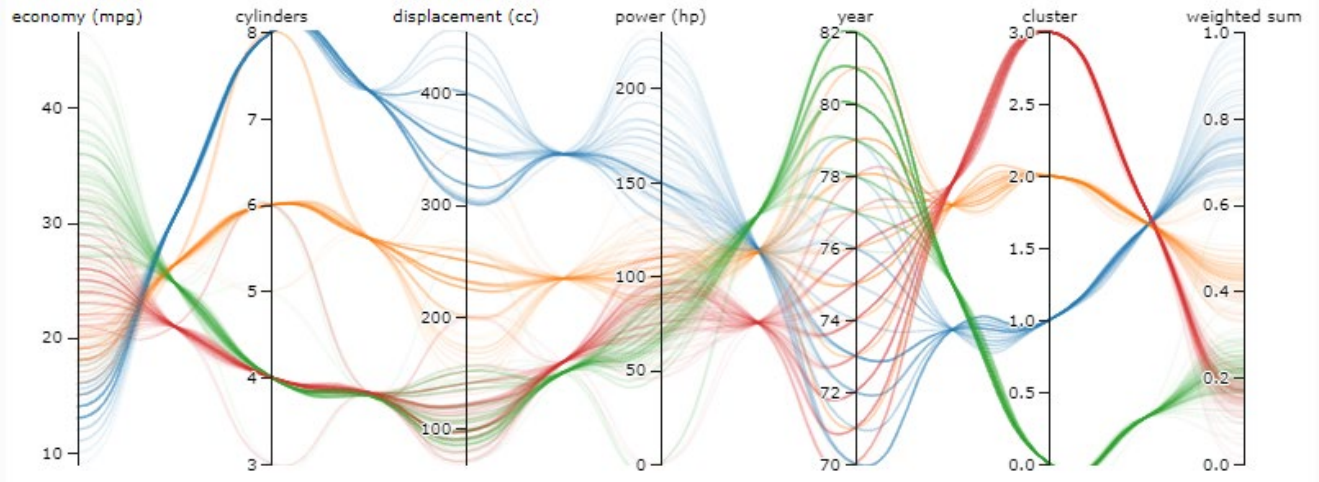
	sepal length	sepal width	petal length	petal width	target
0	5.1	3.5	1.4	0.2	Iris-setosa
1	4.9	3.0	1.4	0.2	Iris-setosa
2	4.7	3.2	1.3	0.2	Iris-setosa
3	4.6	3.1	1.5	0.2	Iris-setosa
4	5.0	3.6	1.4	0.2	Iris-setosa
	a	b	c	d	



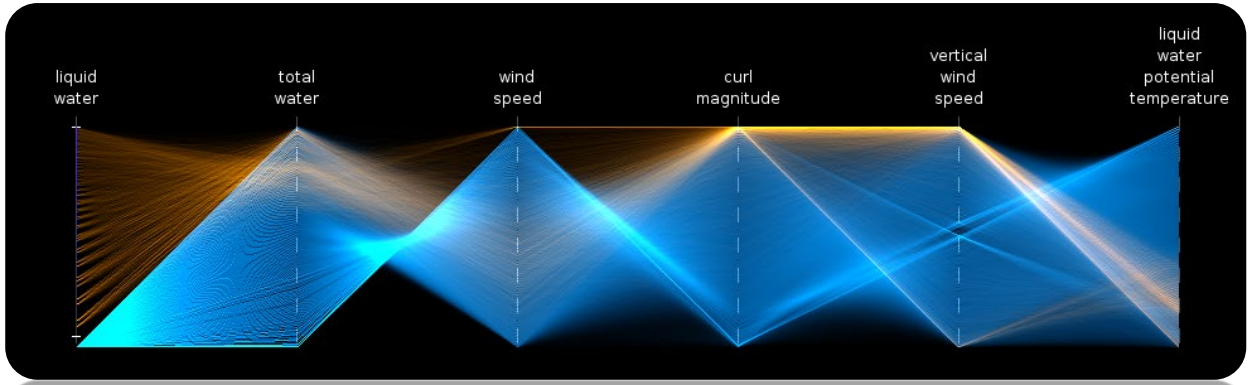
Order of axes matters

Scalability

Scalability: dozens of attributes, millions of items (potentially)

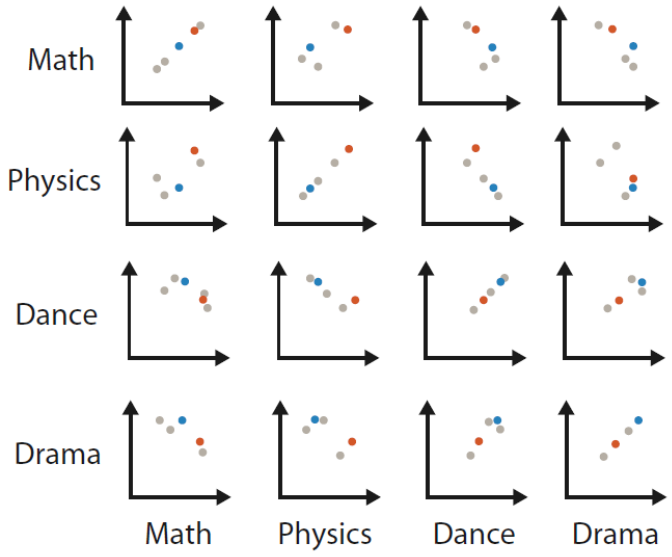


Raseman, William J., Joshuah Jacobson, and Joseph R. Kasprzyk., 2019. "Parasol: An Open Source, Interactive Parallel Coordinates Library for Multi-Objective Decision Making." *Environmental Modelling & Software,* 116, 153–63.

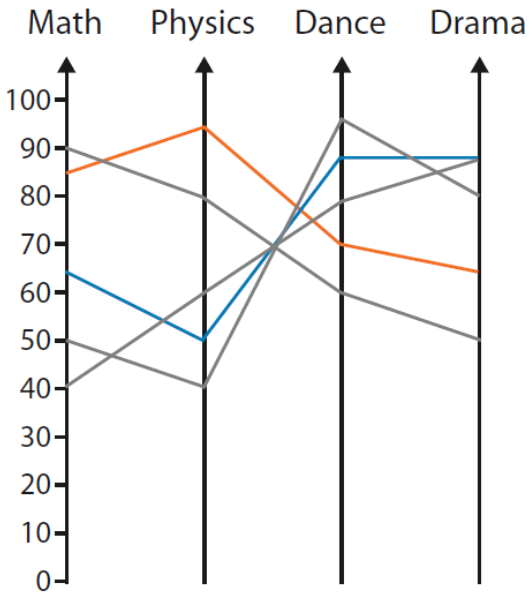


Blaas, J., Botha, C.P. & Post, F.H., 2008. Extensions of Parallel Coordinates for Interactive Exploration of Large Multi-Timepoint Data Sets. *IEEE Transactions on Visualization and Computer Graphics*, 14, 1436-1451.

SPLOMs and PCPs

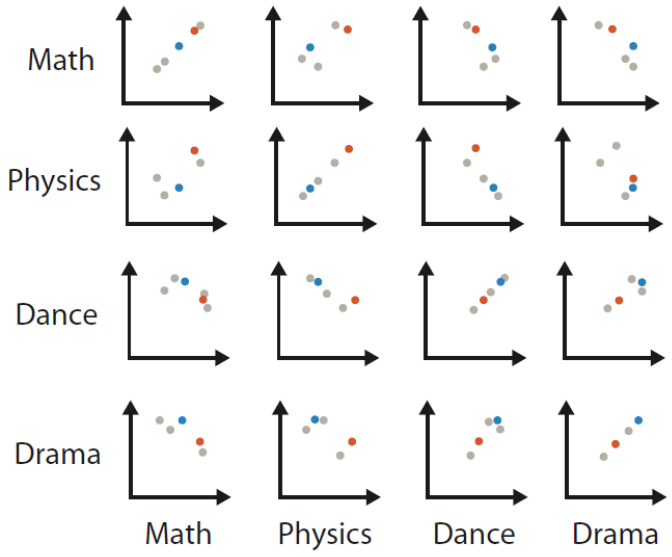


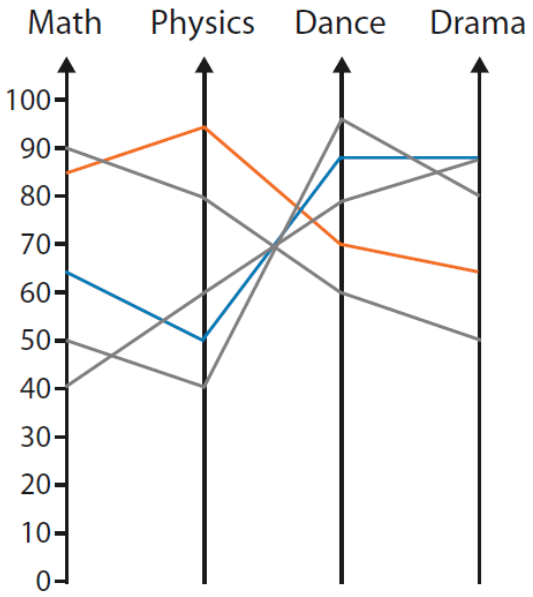
- Primarily relationships between pairs of axis
- Limited scalability (standard rendering)
    - ~ 20 dimensions
    - ~ 500~1k samples
- Brushing is crucial



- Primarily relationships between adjacent axis
- Limited scalability (standard rendering)
    - ~ 50 dimensions
    - ~ 1-5k samples
- Interaction is crucial
- Axis ordering is important

SPLOMs and PCPs





Positive correlation
Diagonal low-to-high

Negative correlation
Diagonal high-to-low

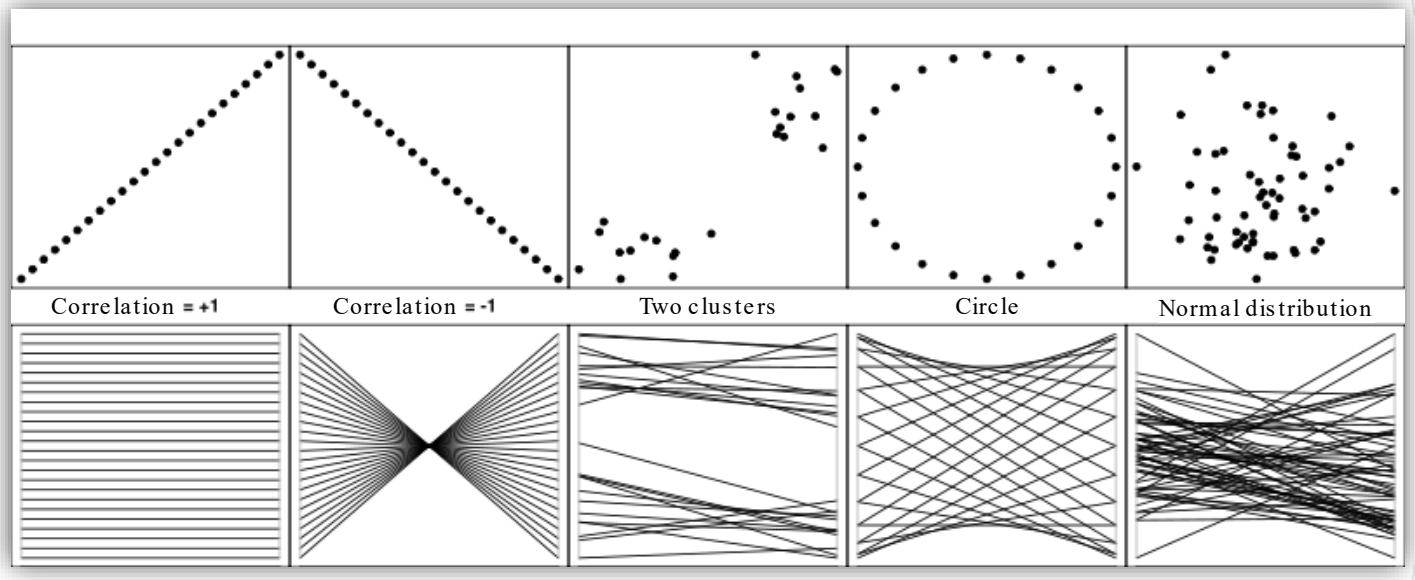
Uncorrelated
Scattered points

Positive correlation
Parallel line segments

Negative correlation
Segments intersect at halfway point

Uncorrelated
Scattered crossings

SPLOMs and PCPs



Radar Plots

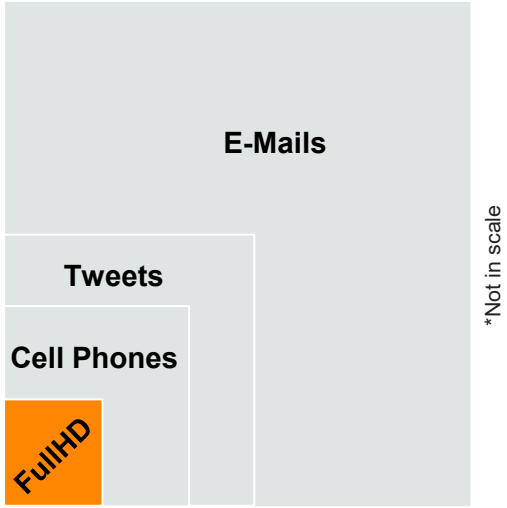
Visualization

Data Reduction

Part I: Introduction & Filtering

Dr. Alessio Arleo

Data is large…



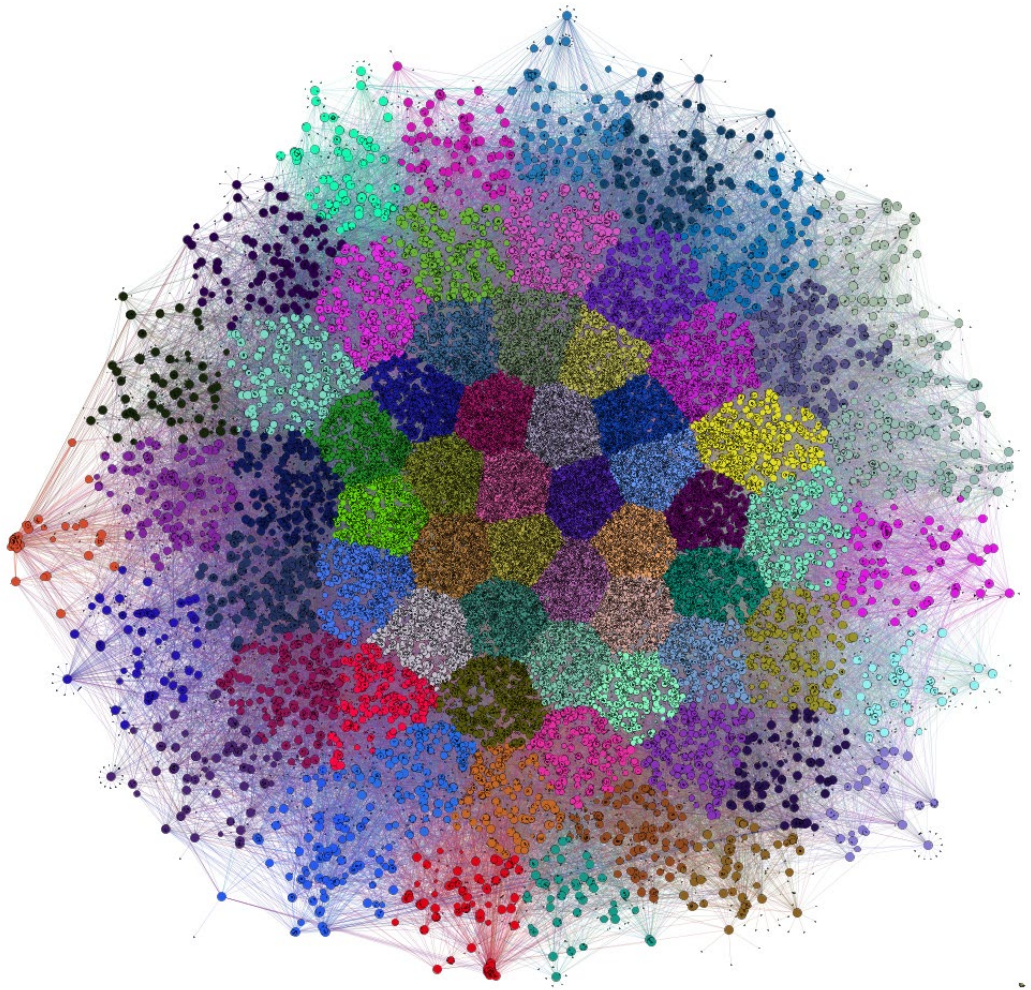
FullHD resolution: 1920 * 1080 = **2.073.000**

Number of cellular phones in Austria (July 2016): **14.027.000**

Tweets sent per day: ~**500.000.000**

Emails sent every day: ~**215.300.000.000**

… And complex



“Only” 30K points and 100k links

Arleo, Alessio, et al. "Large graph visualizations using a distributed computing platform." *Information Sciences* 381 (2017): 124-141.

Data Reduction

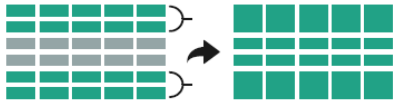
Filter - *Eliminate elements*

- Items

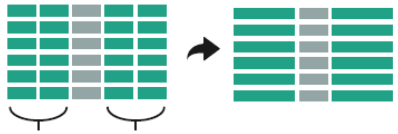
- Attributes

Aggregate - *Generate Representatives*

- Items



- Attributes



Straightforward / intuitive
But: out of sight, out of mind

Summarize dataset
But: details are lost

Filtering elements

Goal: eliminate items based on their values w.r.t. specific attributes.

Number of attributes does not change.

Dynamic Querying & Filtering

Tight loop between encoding and interaction

Immediately show result.

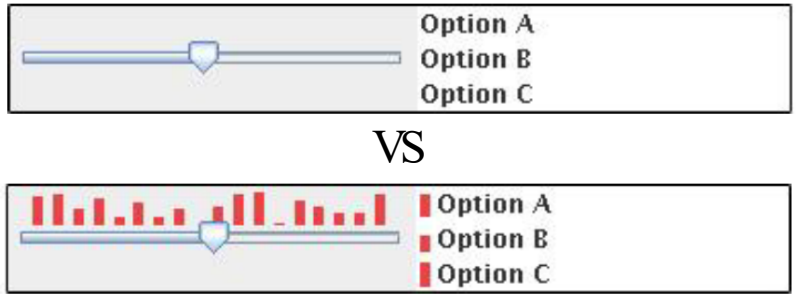
Selection/filtering using vis. queries

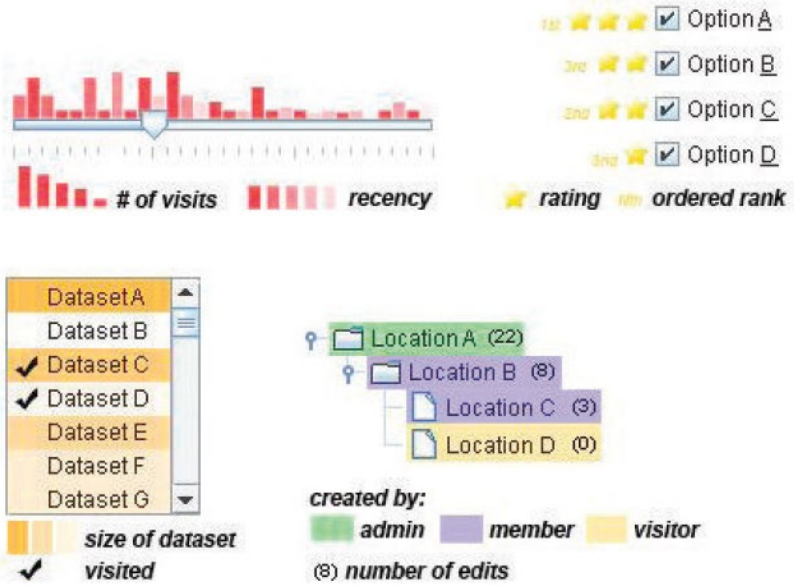
Promotes exploration.

S. van den Elzen and J. J. van Wijk, "Multivariate Network Exploration and Presentation: From Detail to Overview via Selections and Aggregations," in *IEEE Transactions on Visualization and Computer Graphics*, vol. 20, no. 12, pp. 2310-2319, 31 Dec. 2014, doi: 10.1109/TVCG.2014.2346441.

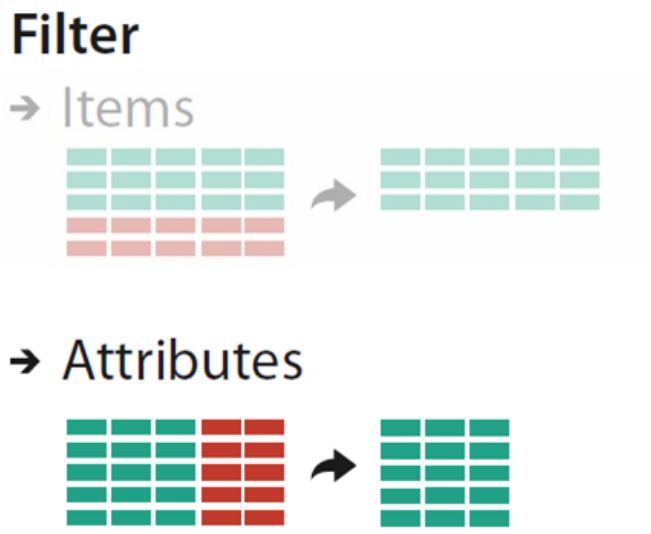
Example: Scented Widgets

Scented Widgets: Improving Navigation Cues with Embedded Visualizations
Wesley Willett, Jeffrey Heer, Maneesh Agrawala
IEEE Information Visualization (InfoVis) 2007





Filtering attributes



Goal: eliminate attributes

Number of items do not change.

Attribute ordering

Determine similarity measure – computational, visual

- Quantitative ordered value for each attribute
- Based on all item values for that attribute

Use that measure to order attributes

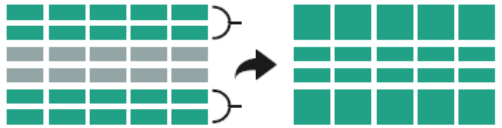
- E.g., filter out highly correlated (and/or vice-versa)

$$r_{xy} = \frac{\sum_{i=1}^{n}(x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i - \bar{x})^2}\sqrt{\sum_{i=1}^{n}(y_i - \bar{y})^2}}$$

Pearson correlation coefficient
(ratio between covariance & std deviation products).
r = 1: perfect positive correlation
r = -1: perfect negative correlation

Aggregation

- Items

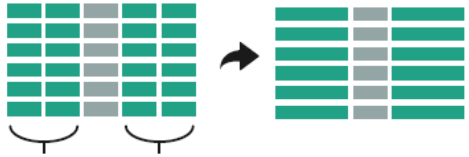


Use of derived elements
(e.g., average)

↓

Histograms
Continuous Scatterplots
Box plots
…

- Attributes



Use of derived attributes
(e.g., by similarity measure)

↓

Dimensionality Reduction

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

Data Reduction

Part II: Aggregation

Dr. Alessio Arleo

Data Reduction

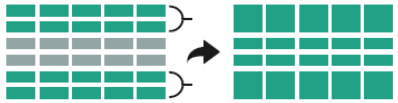
Filter - *Eliminate elements*

- Items

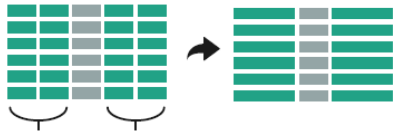
- Attributes

Aggregate - *Generate Representatives*

- Items



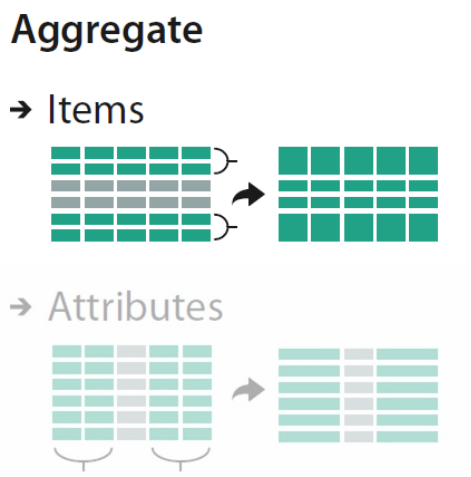
- Attributes



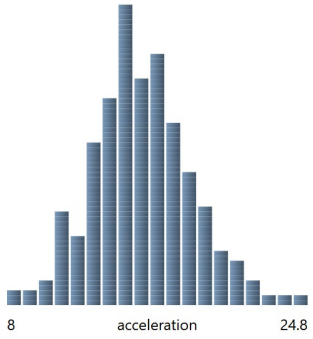
Straightforward / intuitive
But: out of sight, out of mind

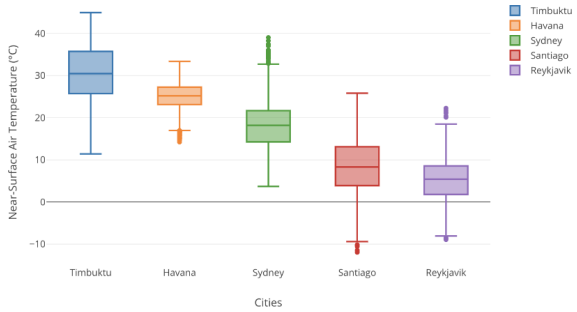
Summarize dataset
But: details are lost

Aggregating Items



- **Goal:** Merge together group of similar items
- **Represent many data items with single mark**

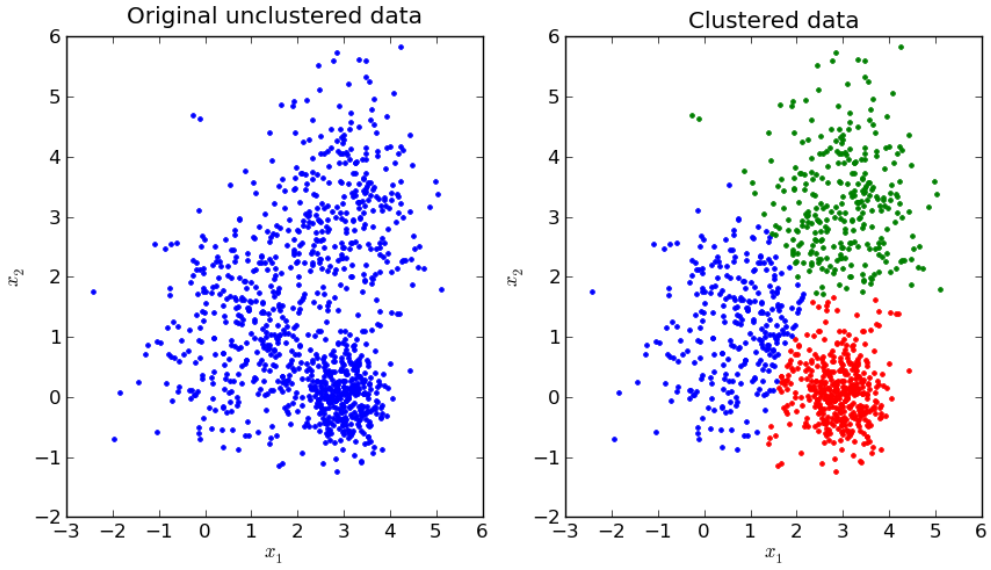


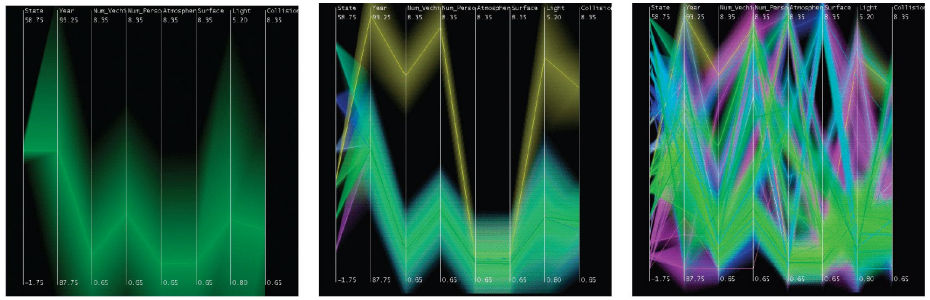


Clustering

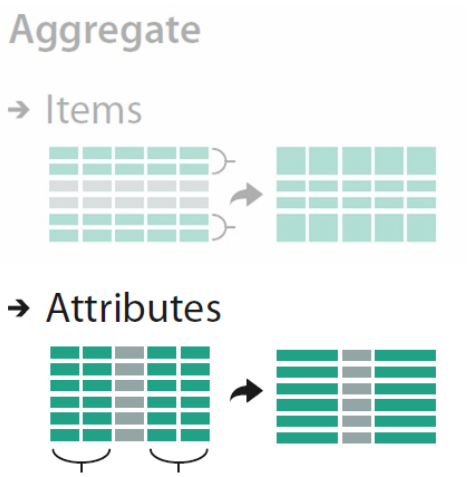
Define groups of similar items

Many algorithms available



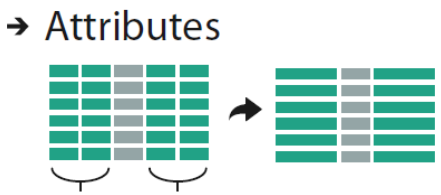


Aggregating Items



- **Goal:** Summarize attributes
- **Number of items does not change**

Attribute Aggregation

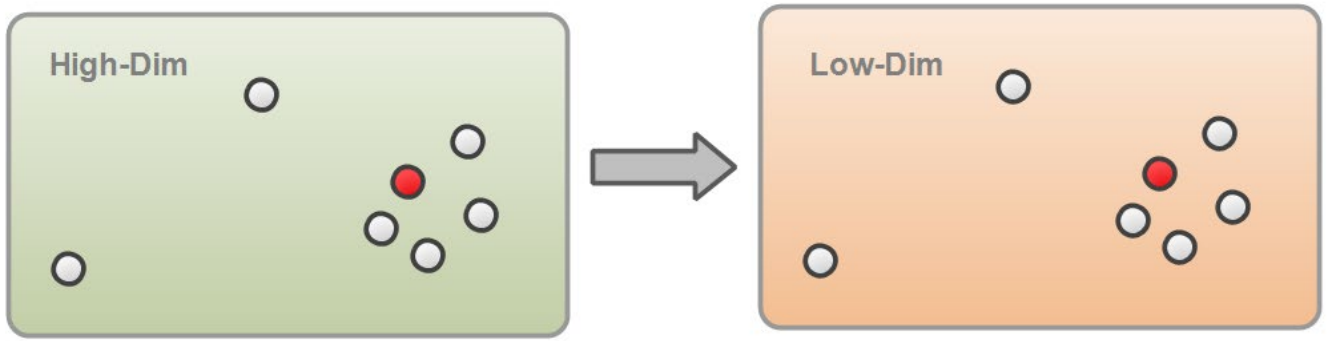


Establish similarity measure

Dimensionality Reduction (**DR**)
Preserve "structure"
of the n-dimensional space

Dimensionality Reduction

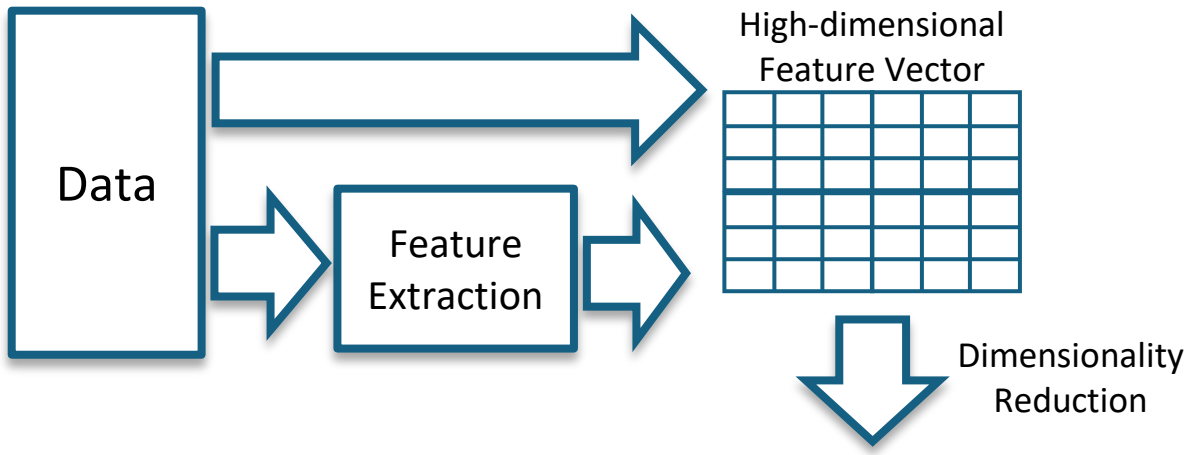
Preserve meaningful structure of a dataset while using fewer attributes to represent the items.
E.g., n-dimensional to 2-dimensional

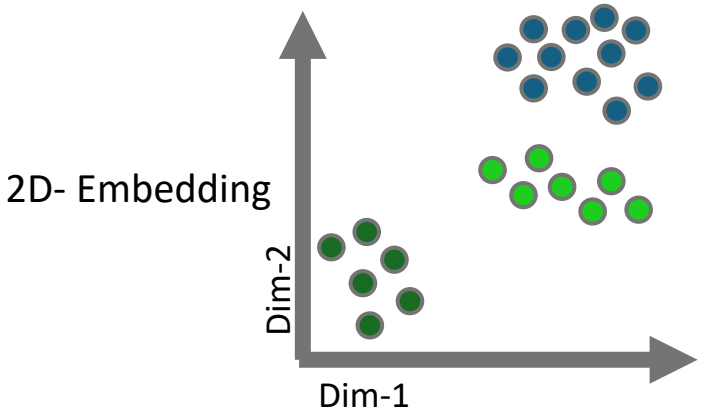


Find combination of attributes to represent the n-dimensional space

Minimize an objective function that measure the discrepancy between similarities in the data and similarities in the projection

Dimensionality Reduction





DR Methods

Linear: Resulting attributes are linear combination of existing attributes (interpretable)

- Principal Component Analysis (PCA) – preserve variation
- Linear Discriminant Analysis (LDA) – preserve class separation
- …

Non-linear: Resulting attributes do not have straightforward relation to original attributes

- Multi-Dimensional Scaling (MDS) - preserve distances
- t-Distributed Stochastic Neighbor Embedding (t-SNE) – preserve neighborhoods https://lvdmaaten.github.io/tsne/
- UMAP (Uniform Manifold Approximation and Projection) – uses Riemannian metric https://github.com/lmcinnes/umap

- …

Interpreting DR-ed Data - Remarks

Only Relative distances matter

This inspection is meant to identify **large clusters**

Fine-grained structure might not be reliably represented

2D scatterplots (SPLOMS): safe idiom choice

For Inspecting DR-ed data [Sedlmaier et al., 2013]

Which method to use?

Depends on tasks and data

M6

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

Maps

Dr.ir. Stef van den Elzen

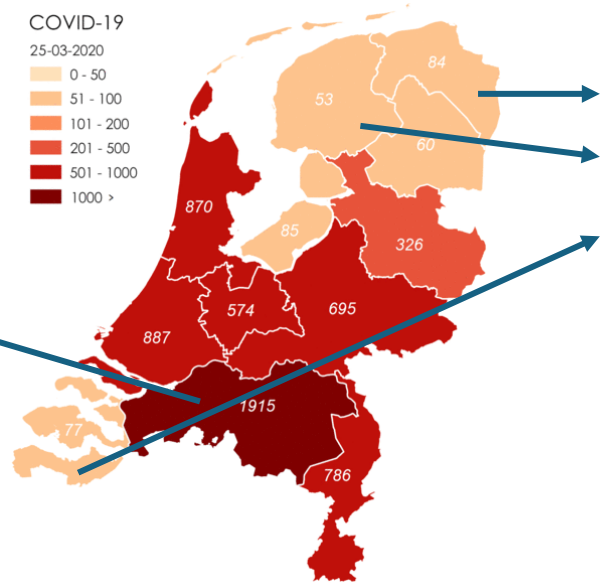
Advantage of maps

Understanding spatial relationships

Familiarity

- People know where something is on a map (assuming they are familiar with the region)
- Maps act as an index from spatial to semantic information and vice-versa.

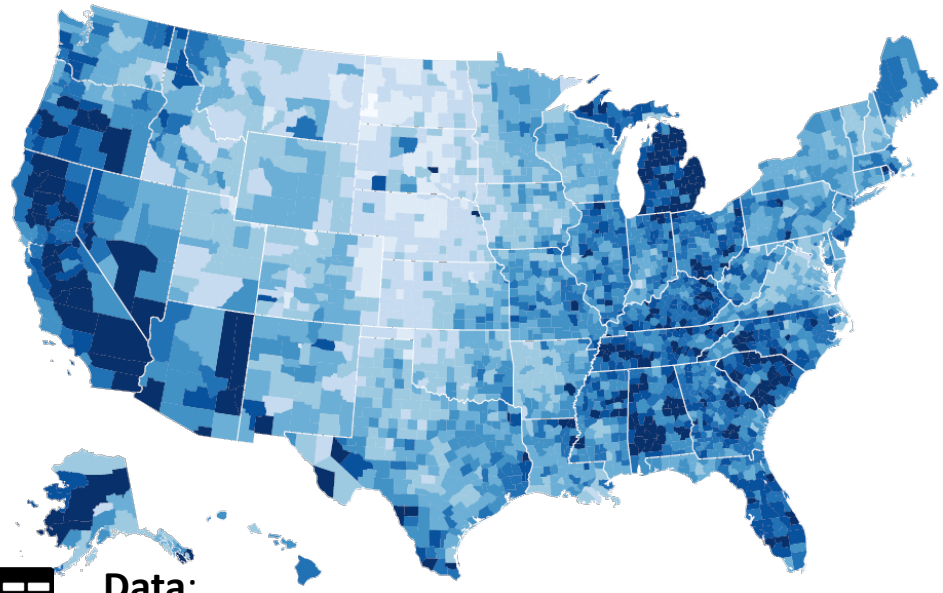
Spatial → semantic:
How many cases of COVID-19
In Noord-Brabant?



Semantic → spatial:
Where are lowest number of COVID-19 cases?

https://simple.wikipedia.org/wiki/File:COVID-19_pandemic_in_the_Netherlands_%E2%80%93_registered_infections_by_province_from_21_to_31_March_2020.gif

Choropleth map



Data:
- 1 Quantitative attribute (table with 1 quantitative attribute per region)
- Geographic geometry

Mark:
- Geometric area

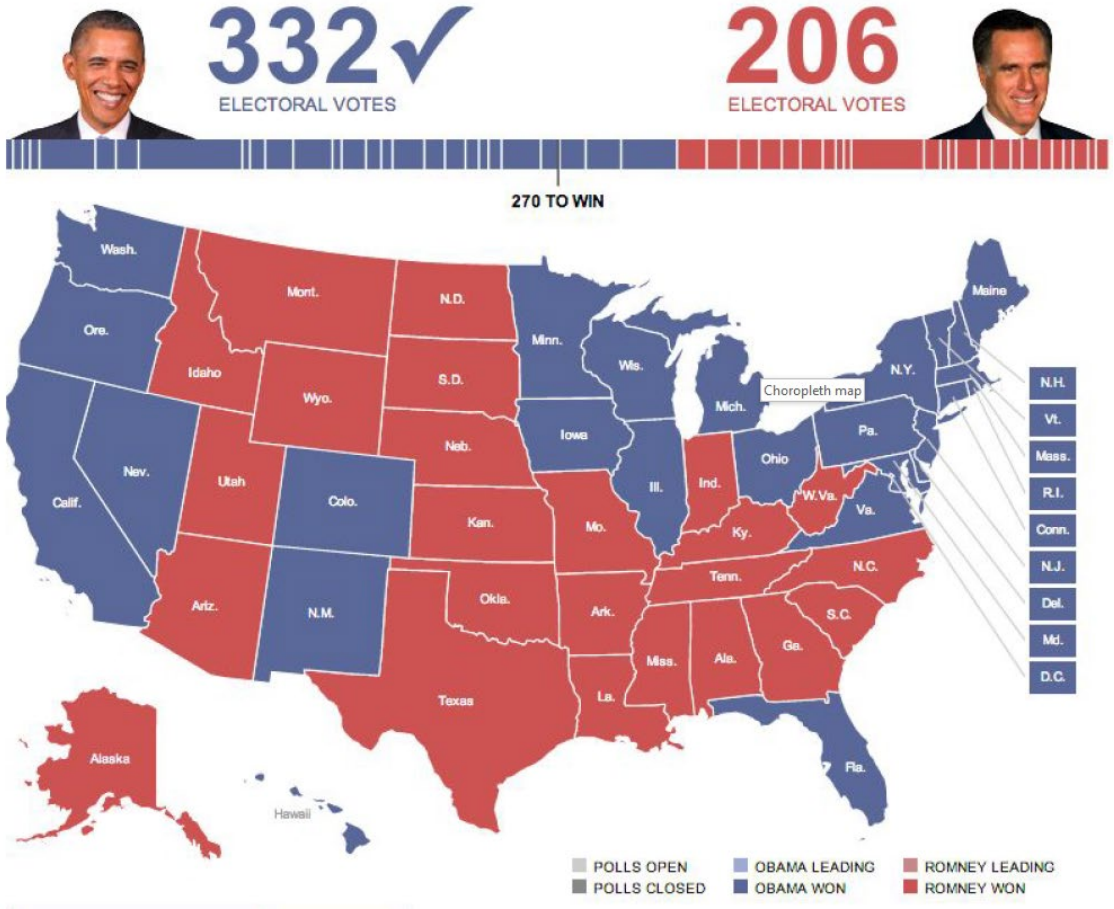
Channels:
- Color

Tasks:
- Understand spatial relationships

http://bl.ocks.org/mbostock/4060606

https://blocks.roadtolarissa.com/mbostock/4060606

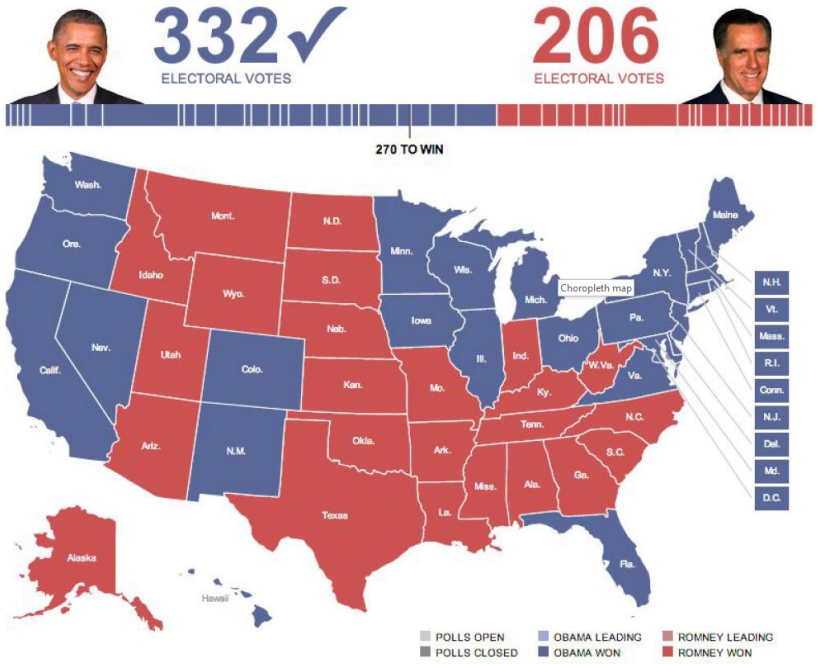
Choropleth map

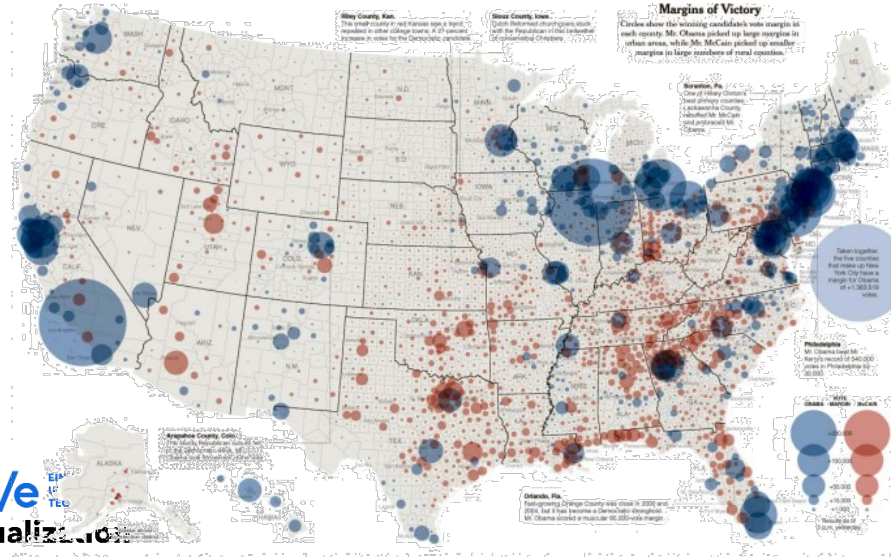


Note that size of objects depends on geography, not on the attributes

http://www.thefunctionalart.com/2012/11/when-choropleth-maps-deceive.html

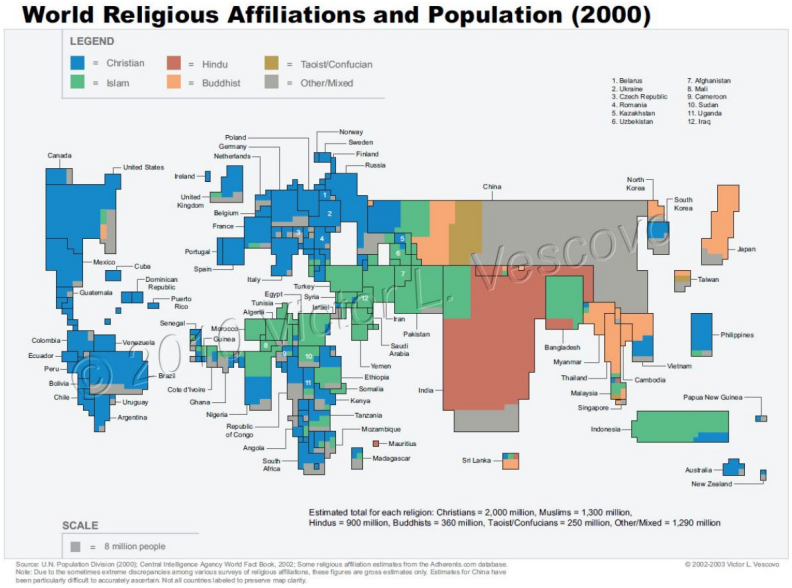
Choropleth map

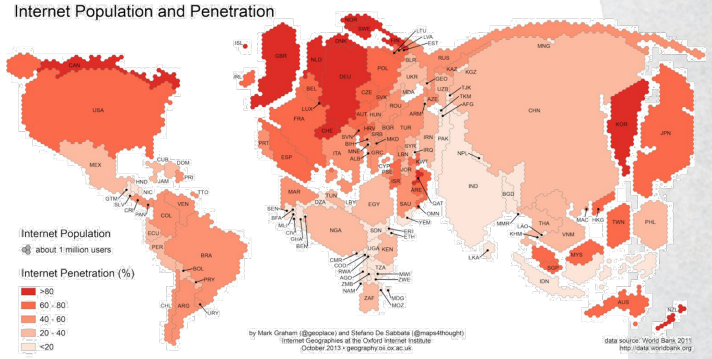


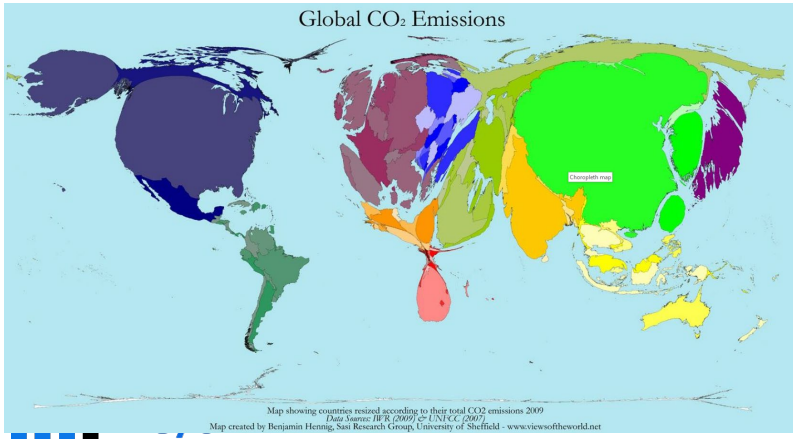


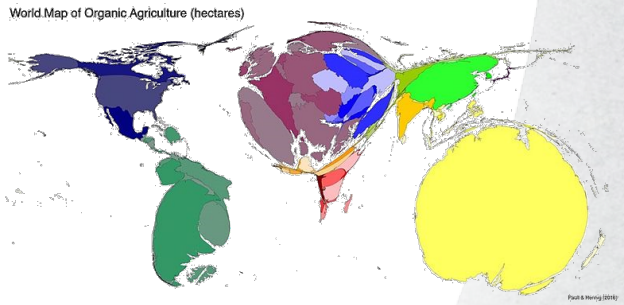
Cartogram

Size represents quantity at cost of familiarity due to distortion.



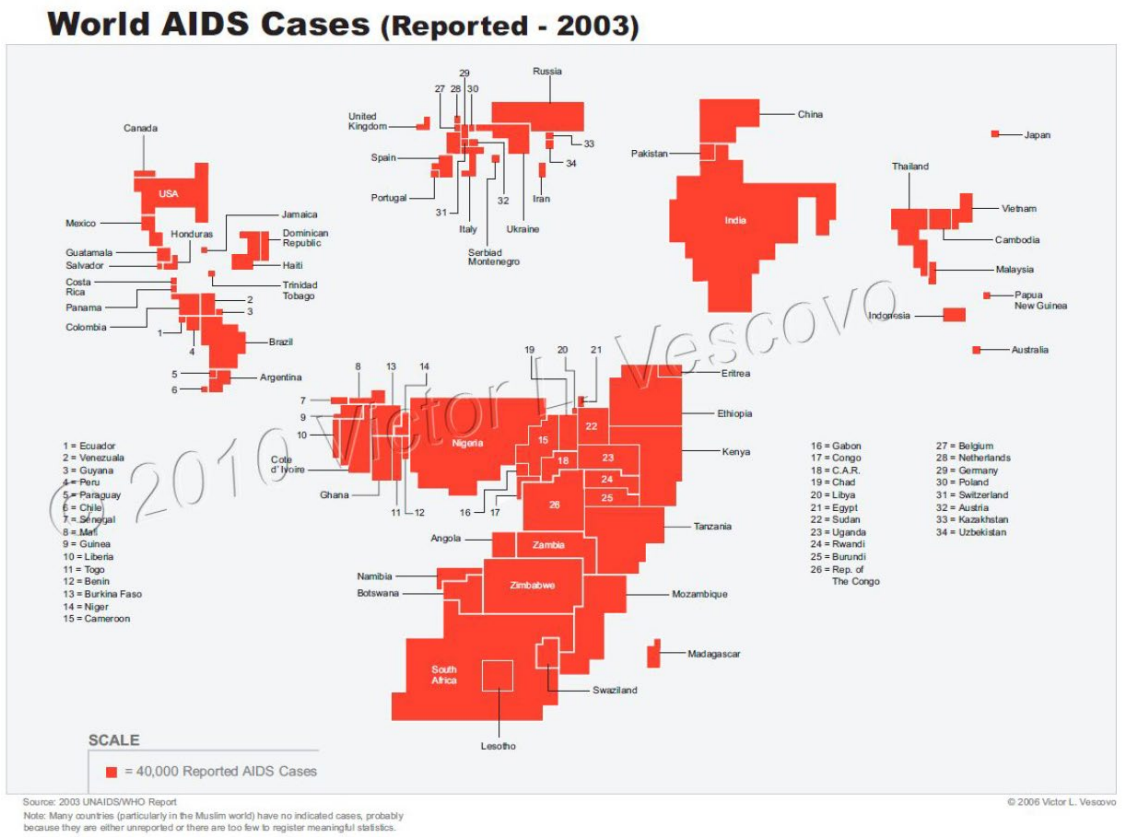




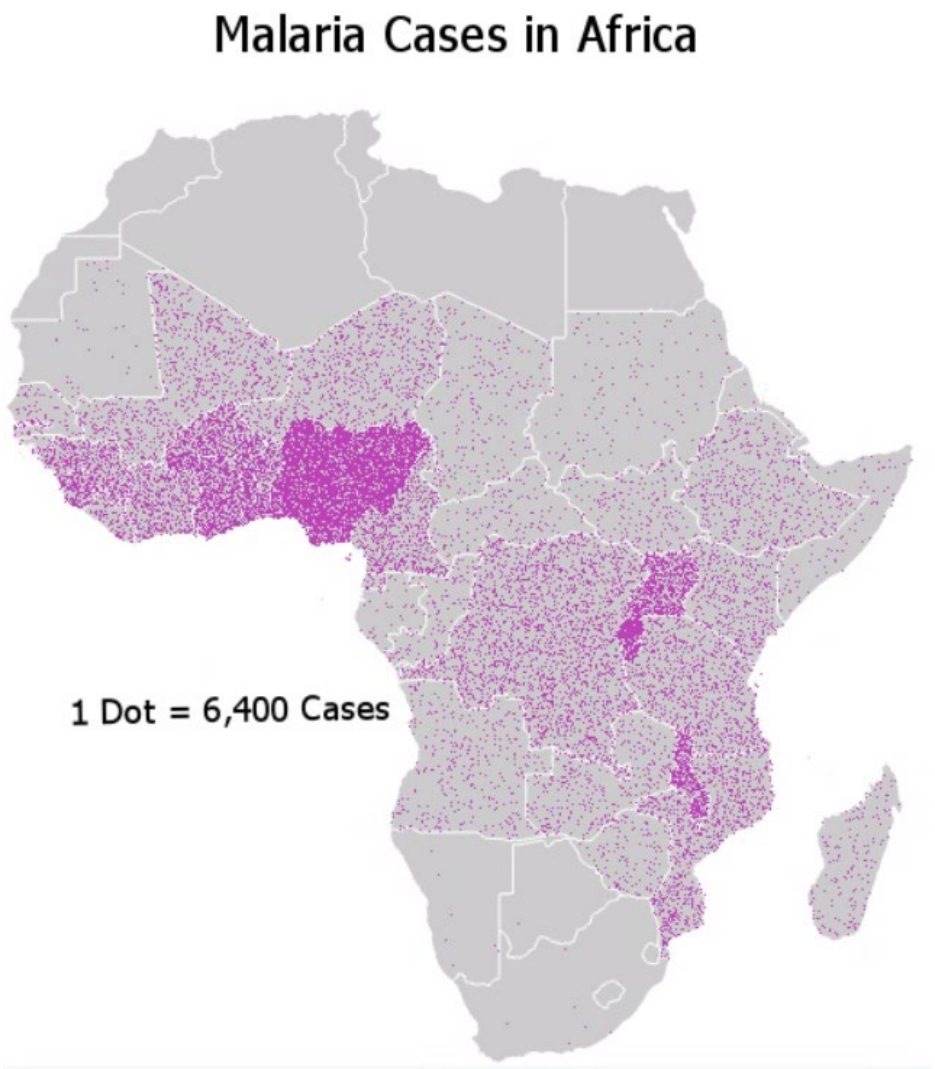


Cartogram

Size represents quantity at cost of familiarity due to distortion.

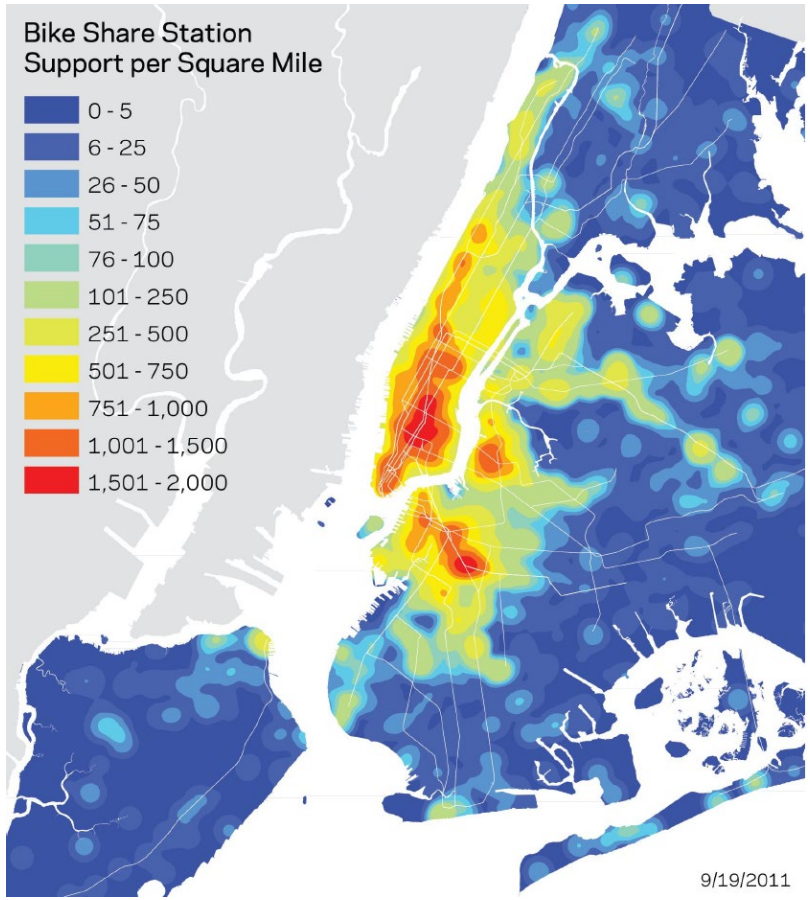


Dot map



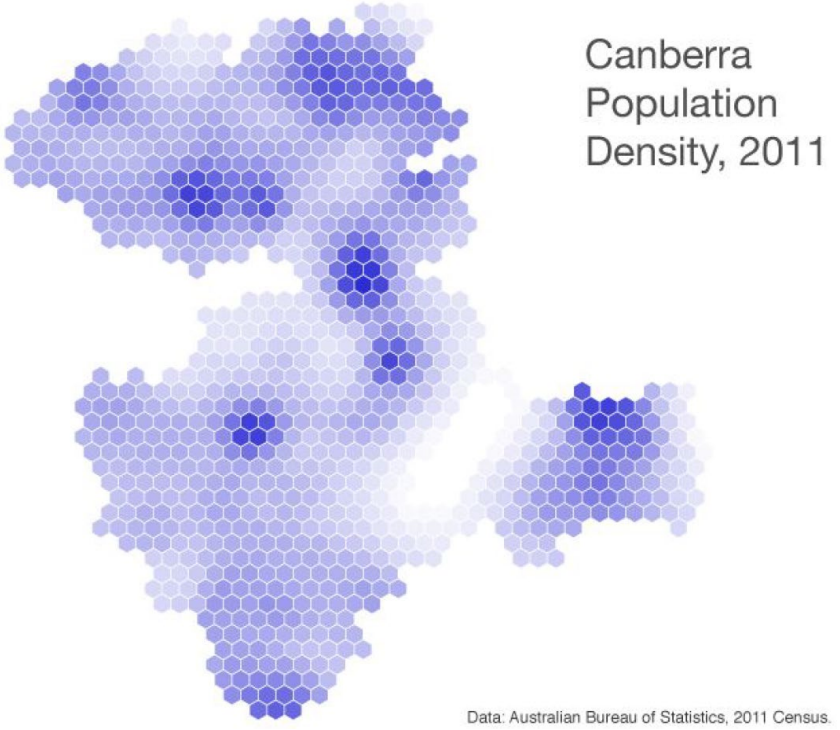
Density maps

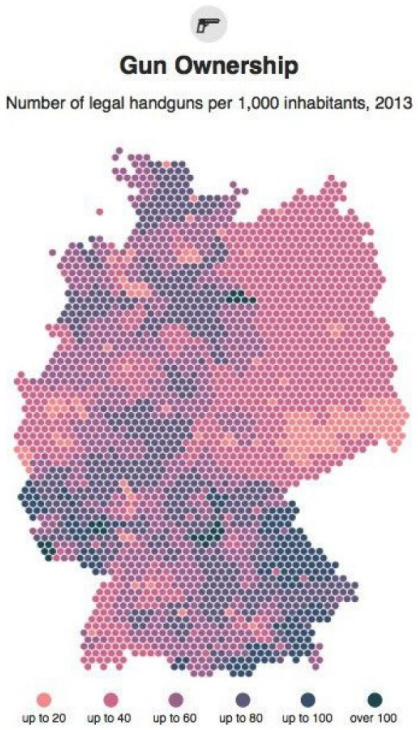
Need a data transformation to turn discrete data into continuous data. Typically using *density estimation* mechanism (e.g., KDE).



Density maps

Need a data transformation to turn discrete data into continuous data. Typically using *density estimation* mechanism (e.g., KDE).

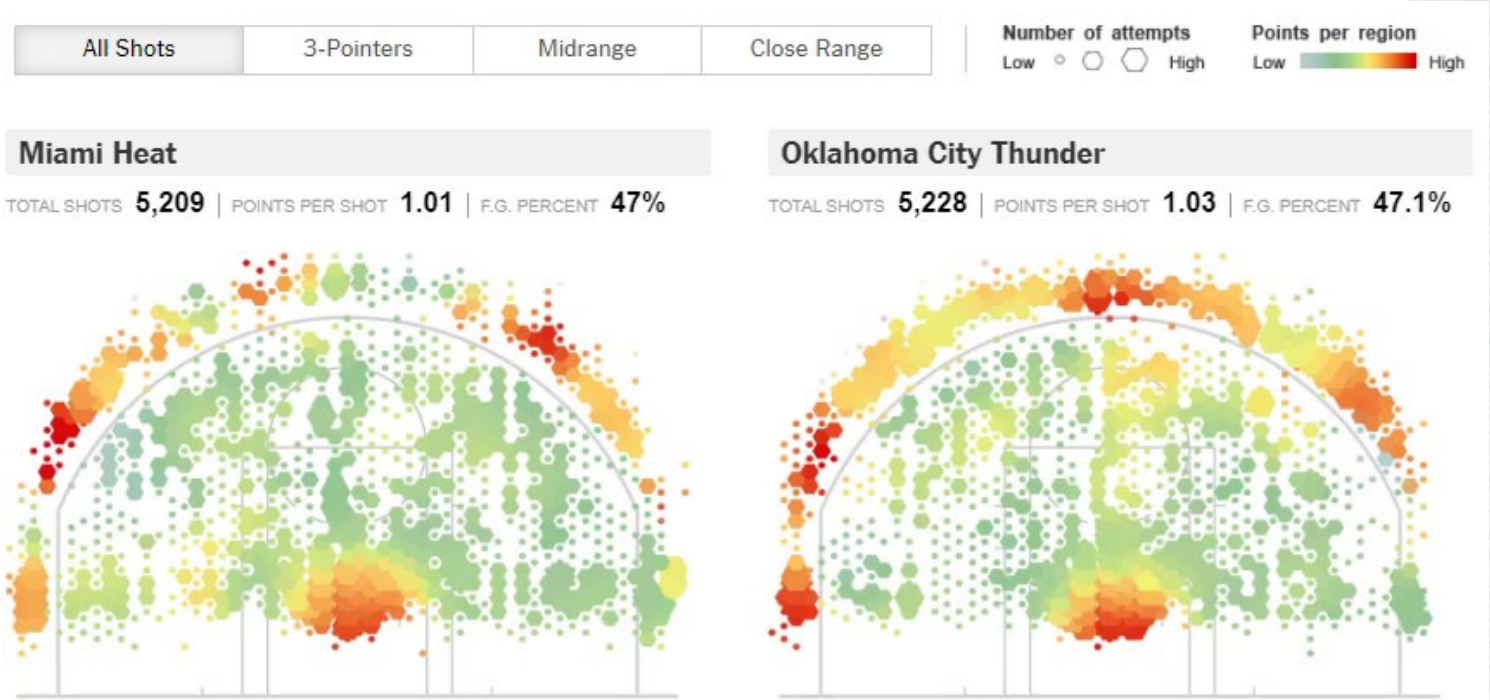




Binning to represent density

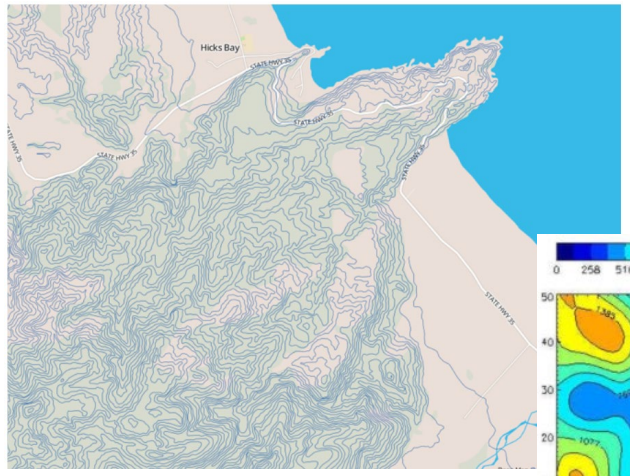
Density maps

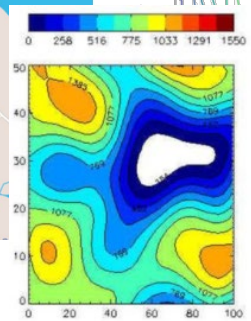
Techniques can also be used for other type of space (not only geographical).

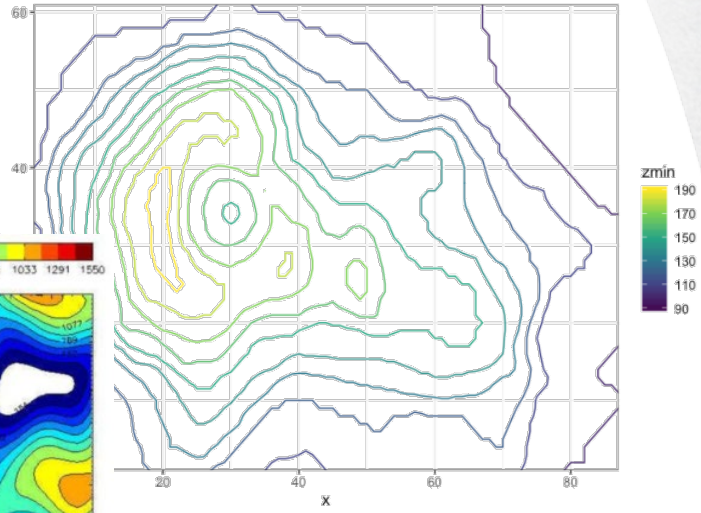


https://archive.nytimes.com/www.nytimes.com/interactive/2012/06/11/sports/basketball/nba-shot-analysis.html

Topographic map







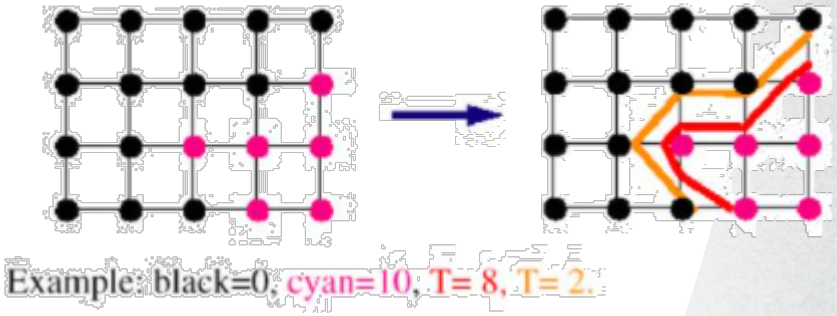
Data:
- Scalar spatial field (1 quantitative attribute per grid cell)
- Geographic geometry

Derived data
- Isoline geometry

Mark:
- Lines

Channels:
- Shape, position, color

Tasks:
- Understand spatial relationships



Caution with maps

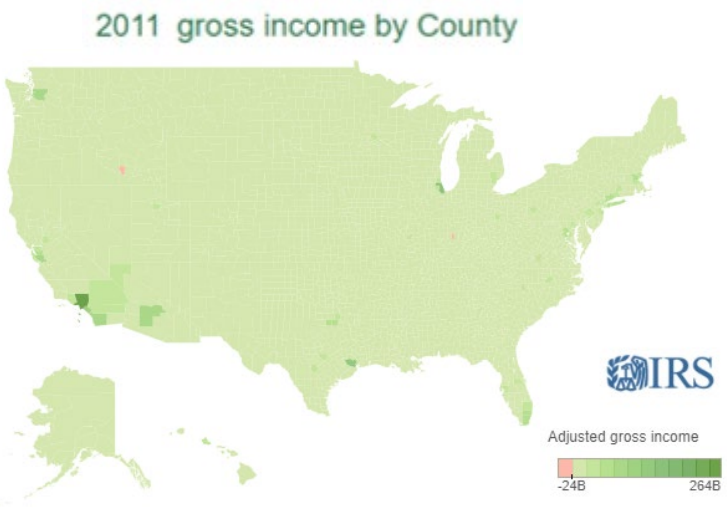
A dataset may contain geographical information

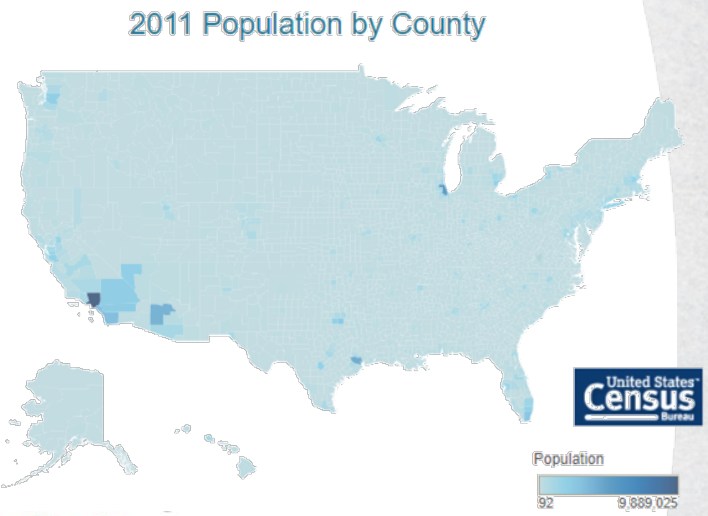
- Yet creating a geographical visualization may not be relevant.
- Ask: “does spatial arrangement matter for my task?”
- Position most effective visual channel → do not waste it, if not relevant.
- A map is not always the best / only solution.

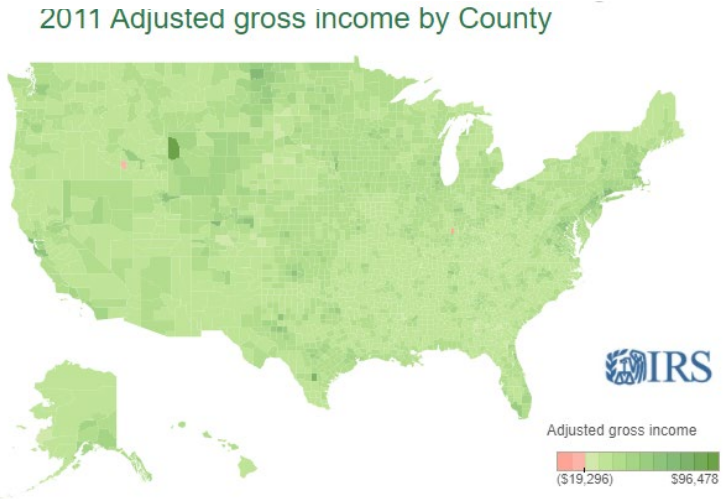
Caution with maps

Absolute vs. relative

- Population density vs. per region





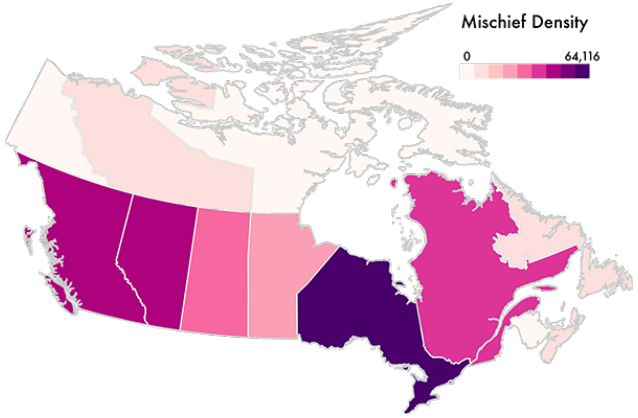


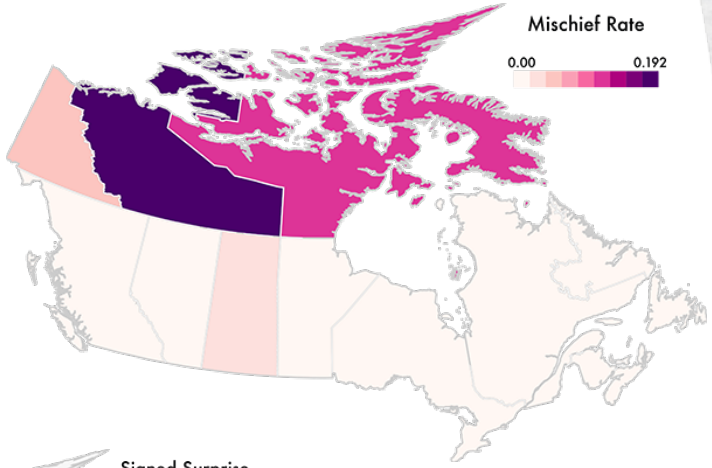
'opVsFin/PopVsFin

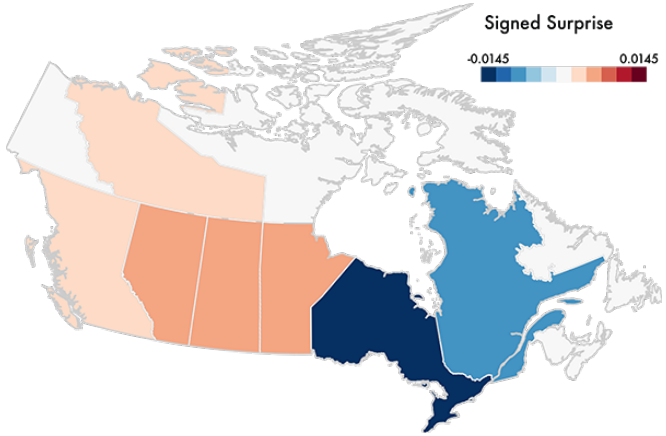
Caution with maps

Absolute vs. relative

- Population density vs. per region
- When populations are low, variations tends to be high







Surprise! Bayesian Weighting for De-Biasing Thematic Maps. Correll and Heer. Proc InfoVis 2016

Summary

Understand spatial relationships

Advantage of maps is familiarity

Maps act as an index from spatial to semantic information and vice-versa

All representations have pros and cons

- Always question yourself whether a map is the best visual encoding

Static Networks

Static Networks

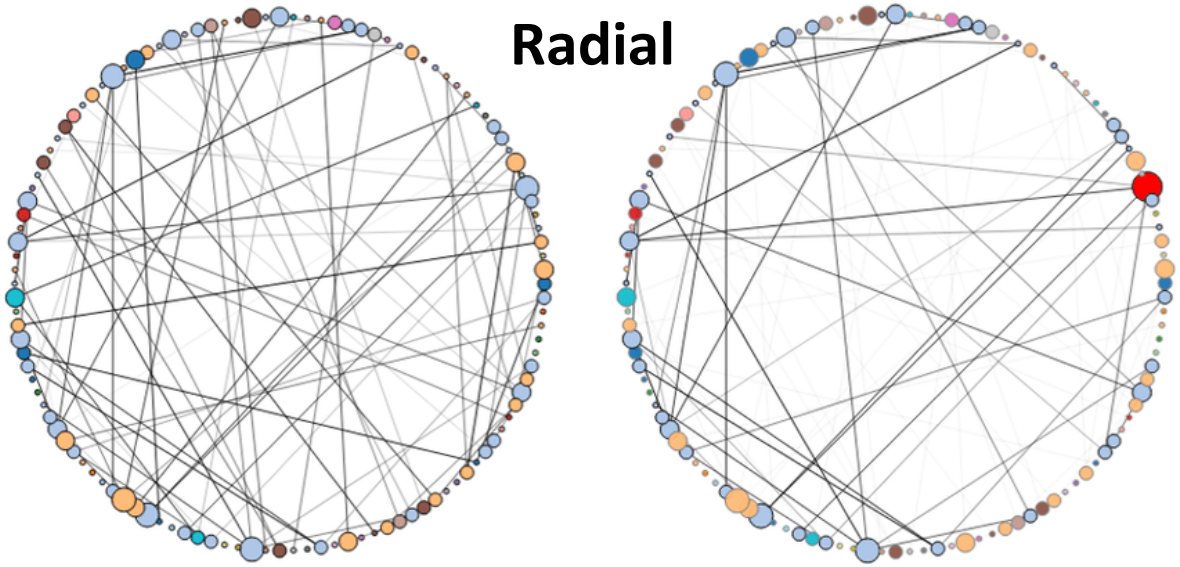
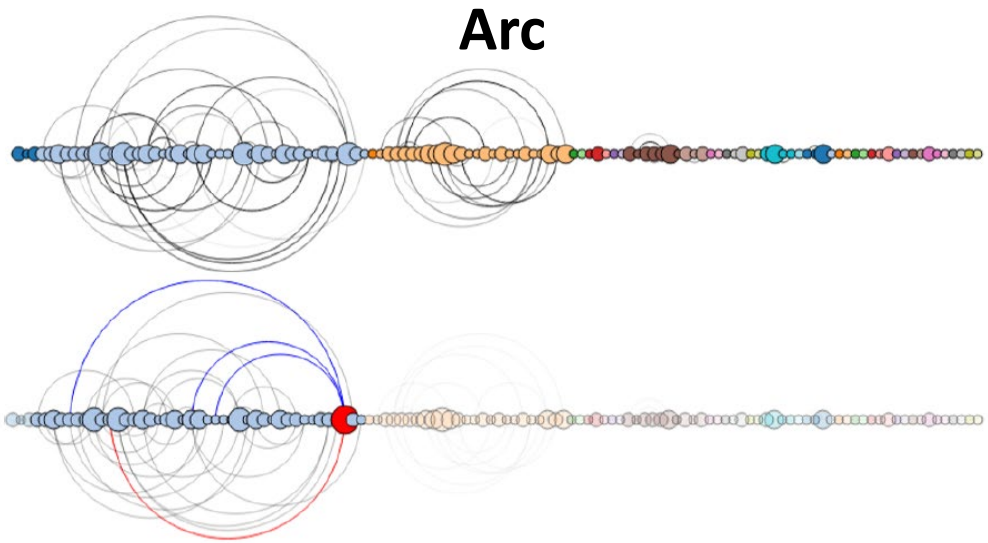
Radial

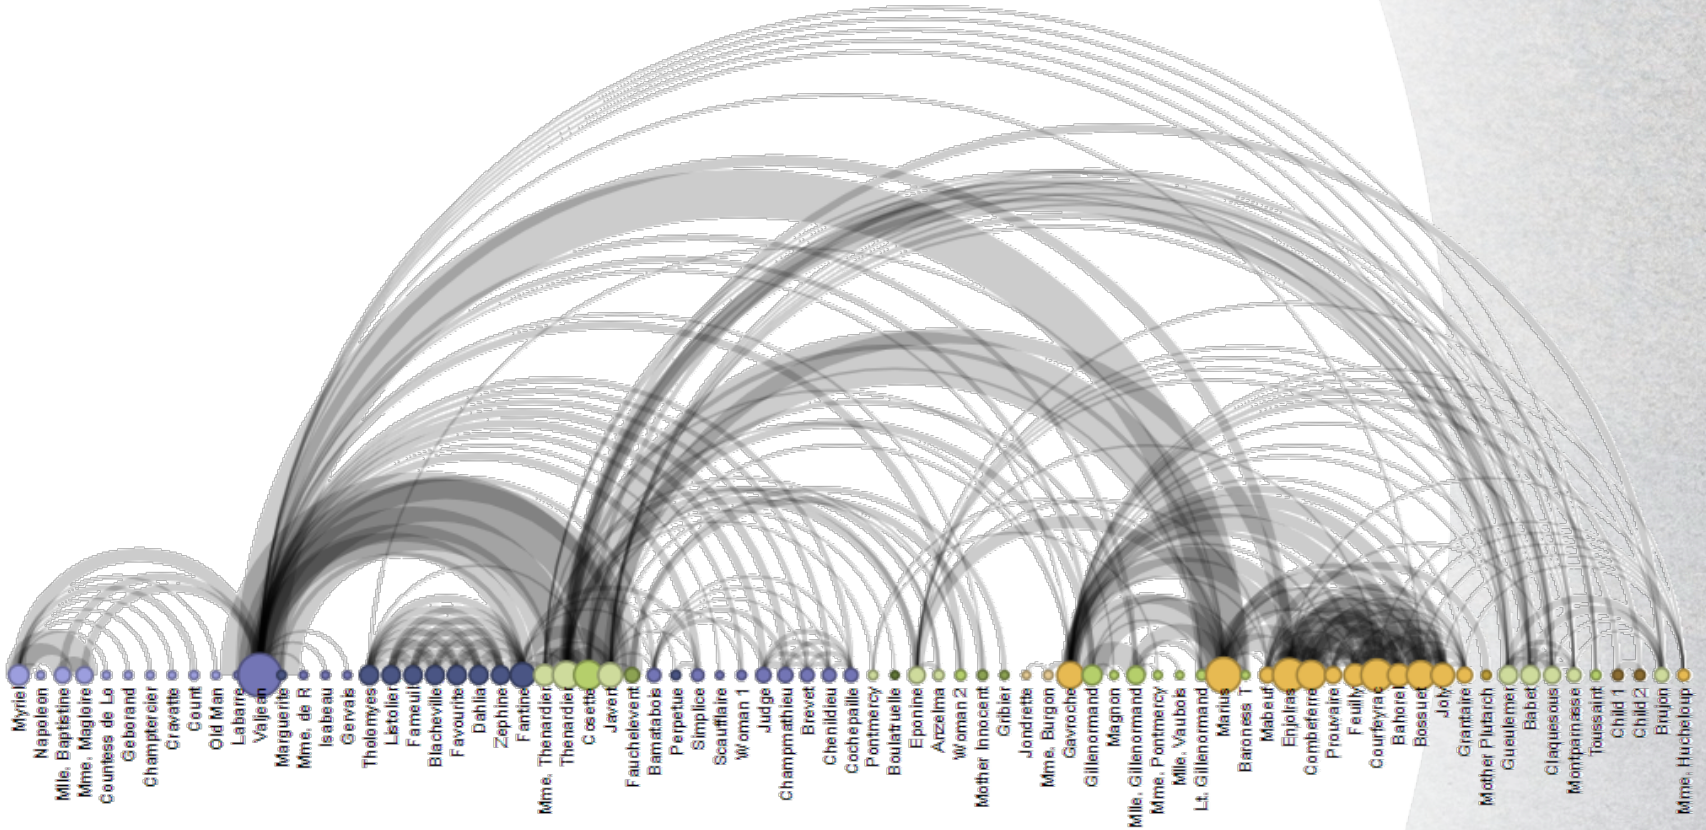


Arc



Linearize nodes: ordering plays a very important role

Static Networks



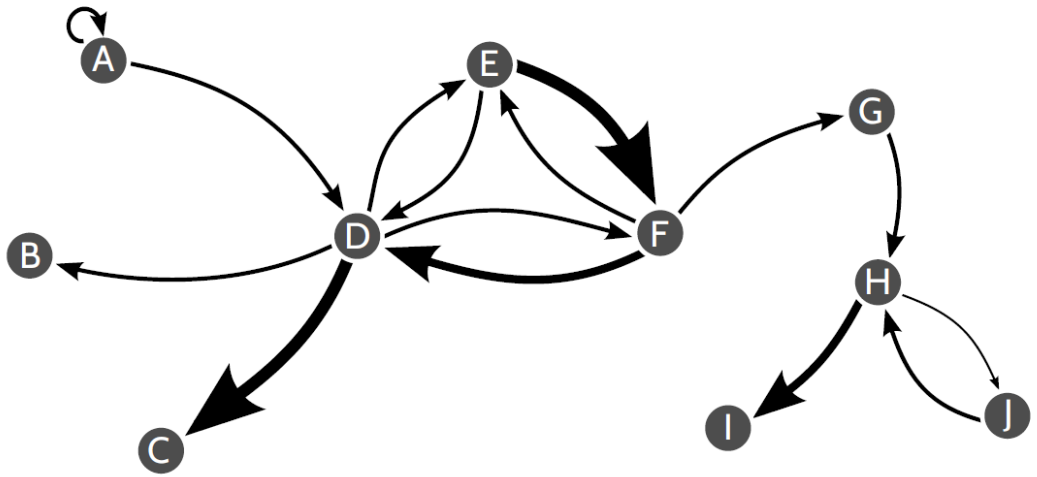
https://homes.cs.washington.edu/~jheer/files/zoo/ex/networks/arc.html

Static Networks

Static network visualization

- Node-link diagram easy to understand by non-experts

Positioning of nodes is called *layout* or *embedding*
Compute layouts → graph drawing (force directed methods).



Static Networks

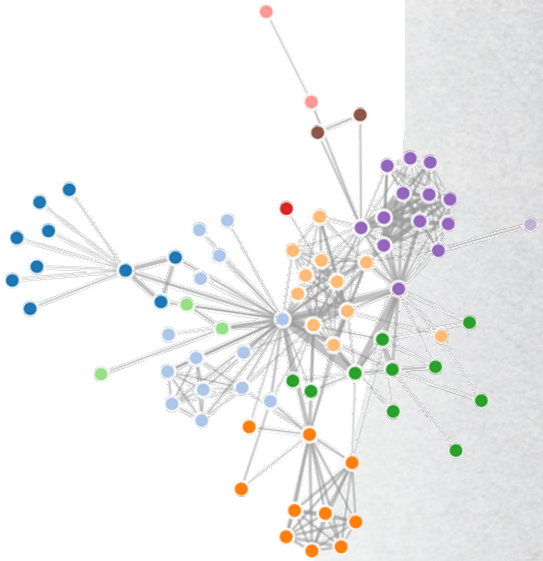
Static network visualization

- Node-link diagram easy to understand by non-experts

Positioning of nodes is called *layout* or *embedding*
Compute layouts → graph drawing (force directed methods).

Readability & aesthetics

- Equal edge length
- Minimize crossings
- Non-overlapping nodes
- High-degree nodes should have a central position
- Symmetry should be maximized
- Communities should be clearly visible

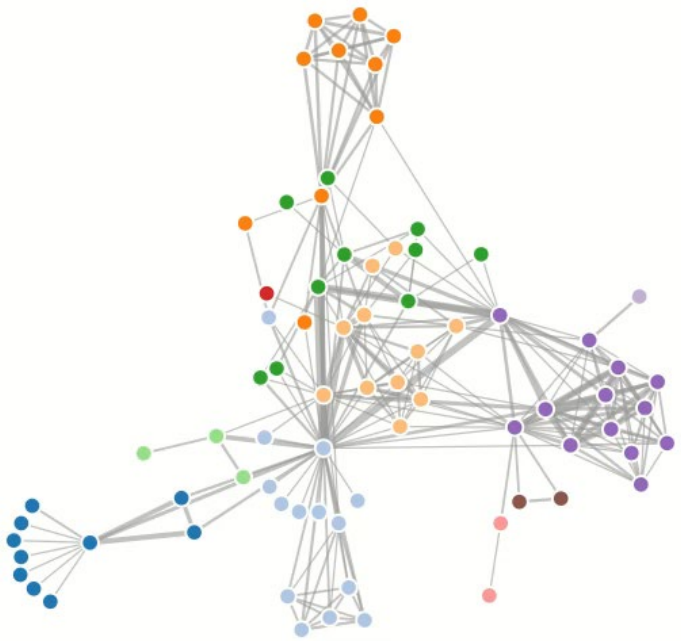


Conflicting – NP-hard optimization problems
→ Use heuristics to solve this.

Static Networks

Force-directed algorithms

- Mechanical laws
- Model edges as springs, also nodes repel each other
- Numerically simulate until stable state is reached



https://blocks.roadtolarissa.com/mbostock/raw/4062045/index.html

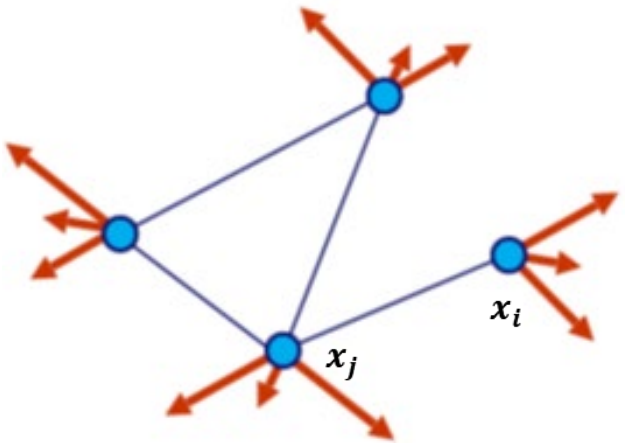
Static Networks

Vertex Force

- Repelling force between vertices i and j
- Prevents vertices to come too close to each other

Repulsion strength

$$\boldsymbol{g}_{ij} = \frac{r_{ij}}{d^2\,(\boldsymbol{x}_i, \boldsymbol{x}_j)} \frac{\boldsymbol{x}_i - \boldsymbol{x}_j}{d(\boldsymbol{x}_i, \boldsymbol{x}_j)}$$



Static Networks

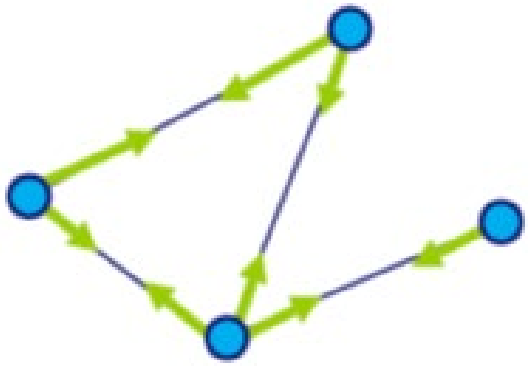
Edge Force

- Spring forces on edge
- Attracts vertices connected by edge
- Prevents these vertices from getting too far apa**rt**

Spring tension

Spring length

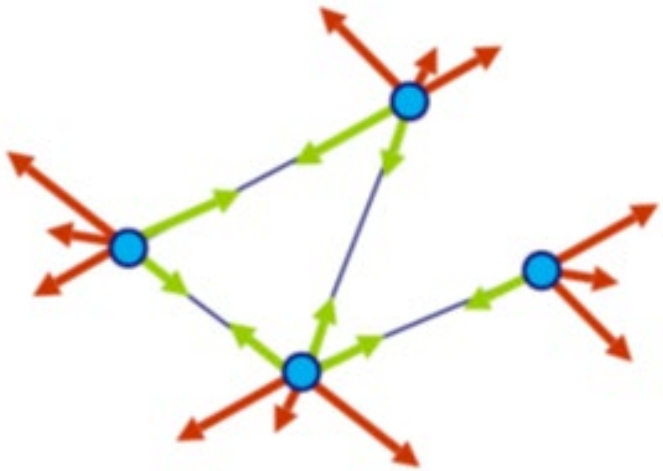
$$\boldsymbol{f}_{ij} = k_{ij}(d(\boldsymbol{x}_i, \boldsymbol{x}_j) - s_{ij})\frac{\boldsymbol{x}_i - \boldsymbol{x}_j}{d(\boldsymbol{x}_i, \boldsymbol{x}_j)}$$

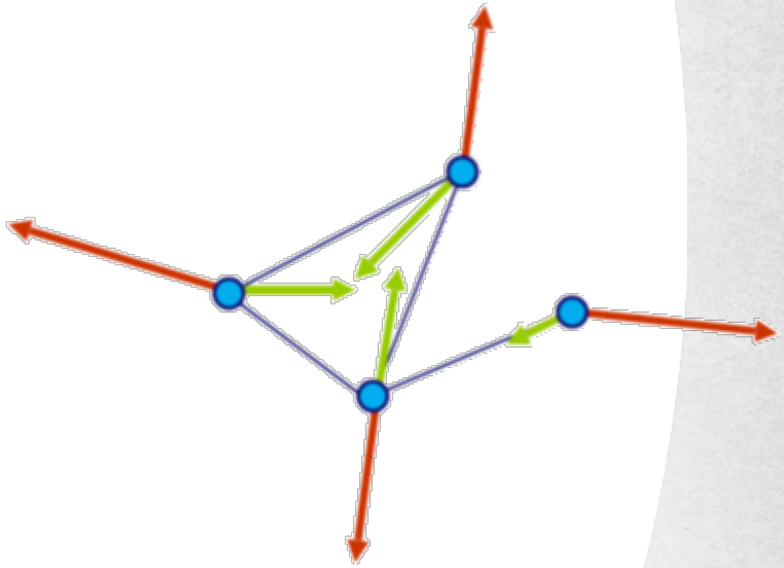


Static Networks

Forces in action

- Compute repulsion and attraction forces for all nodes

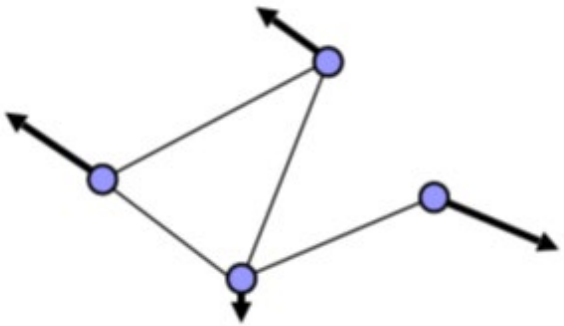




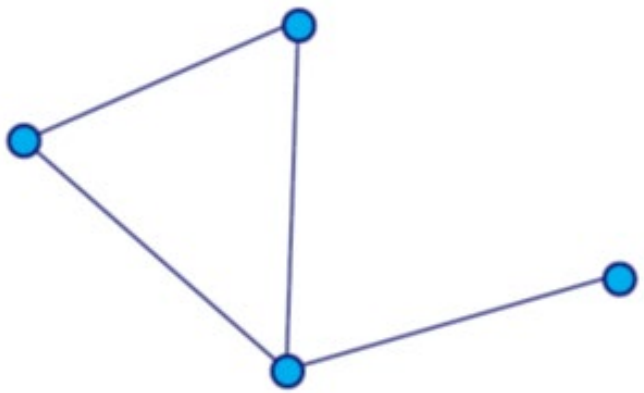
Static Networks

Forces in action

- Compute net forces



- Move vertices to new position



Static Networks

Termination

- Fixed number of iteration
- Total energy below some threshold
- Local minimum
- User input

Tasks

- Explore topology, locate paths,
- Identify communities, node centrality

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

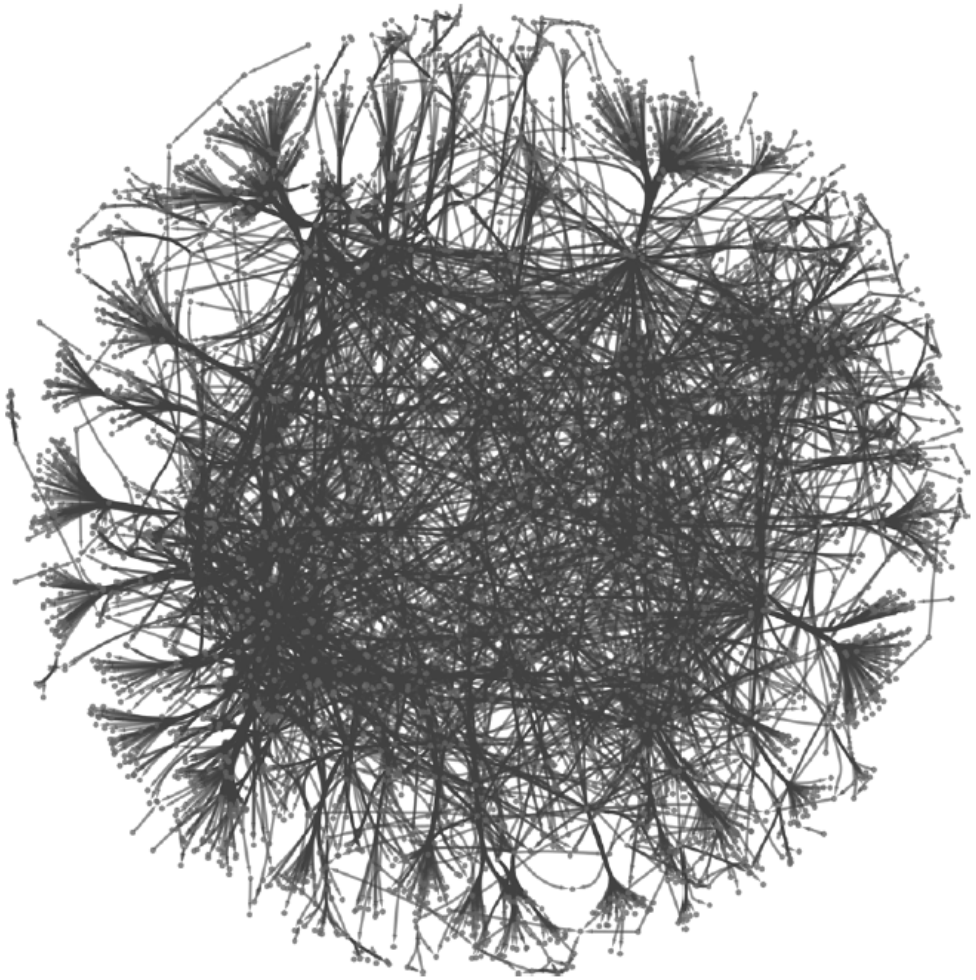
Graphs

Large Networks

Dr.ir. Stef van den Elzen

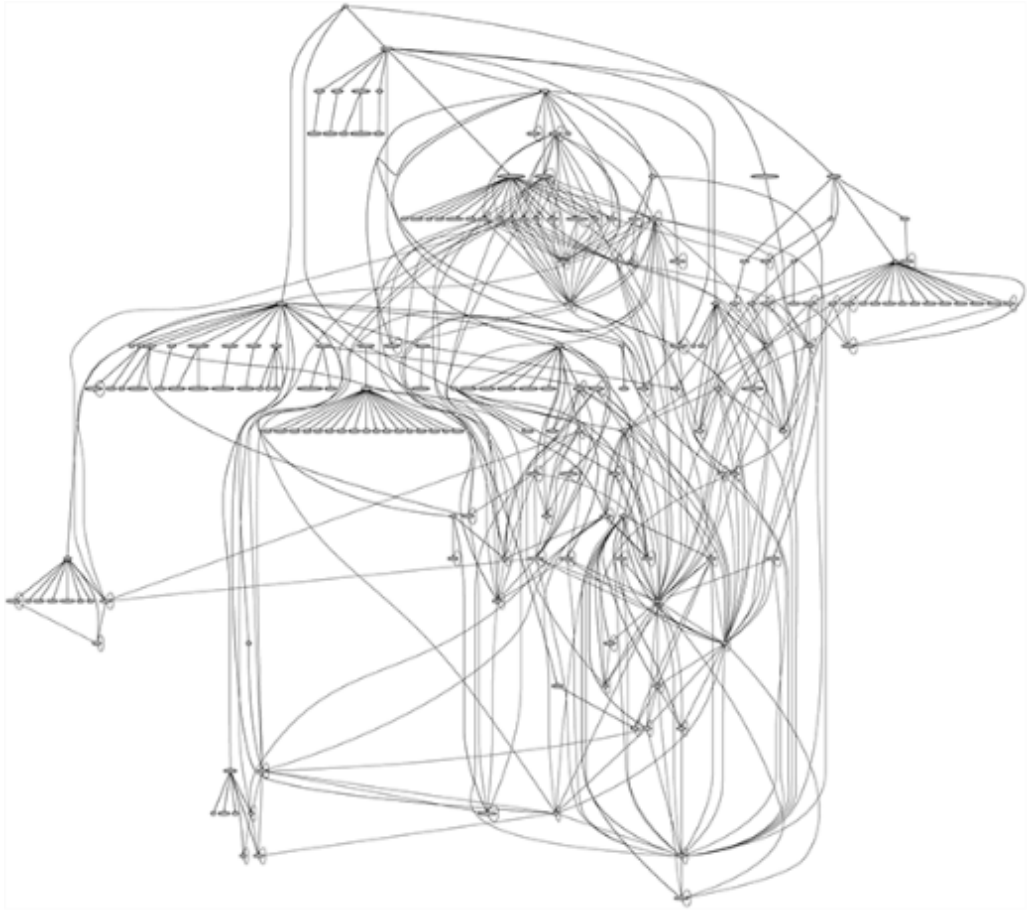
Large networks

Traditional (force-directed) network visualizations do not scale



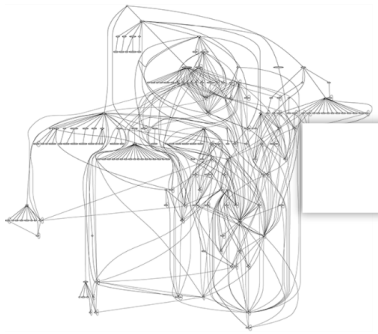
2924 nodes, 6827 edges, edge bundling to improve readability

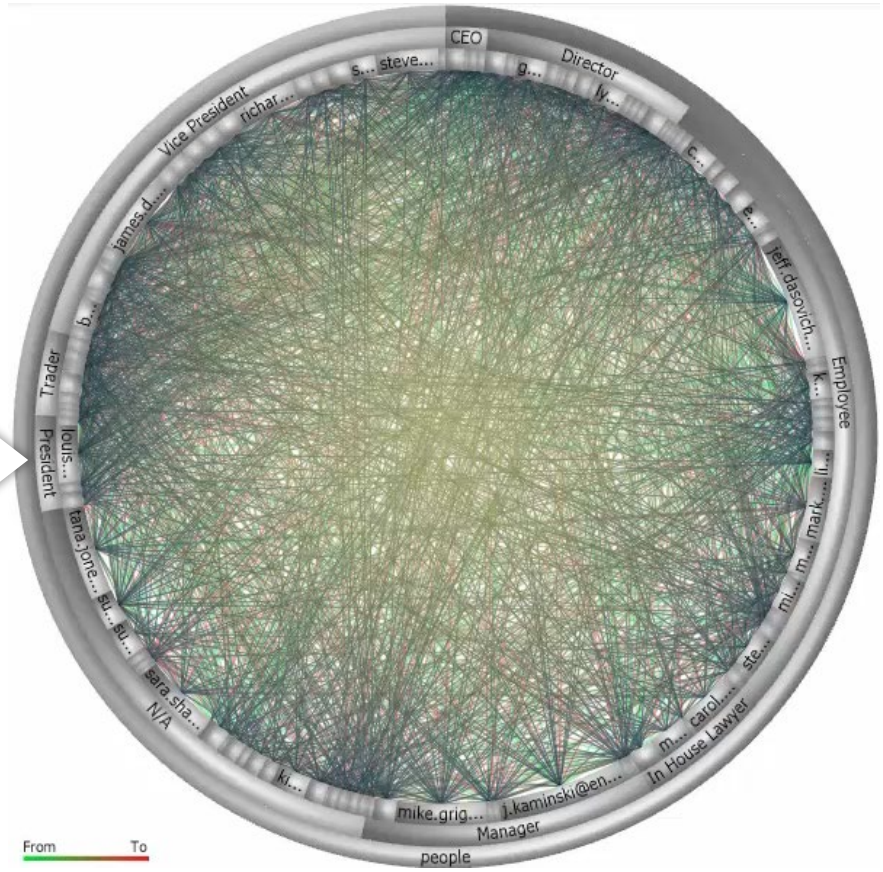
Large network visualization



Network + Hierarchy = compound network

Large network visualization



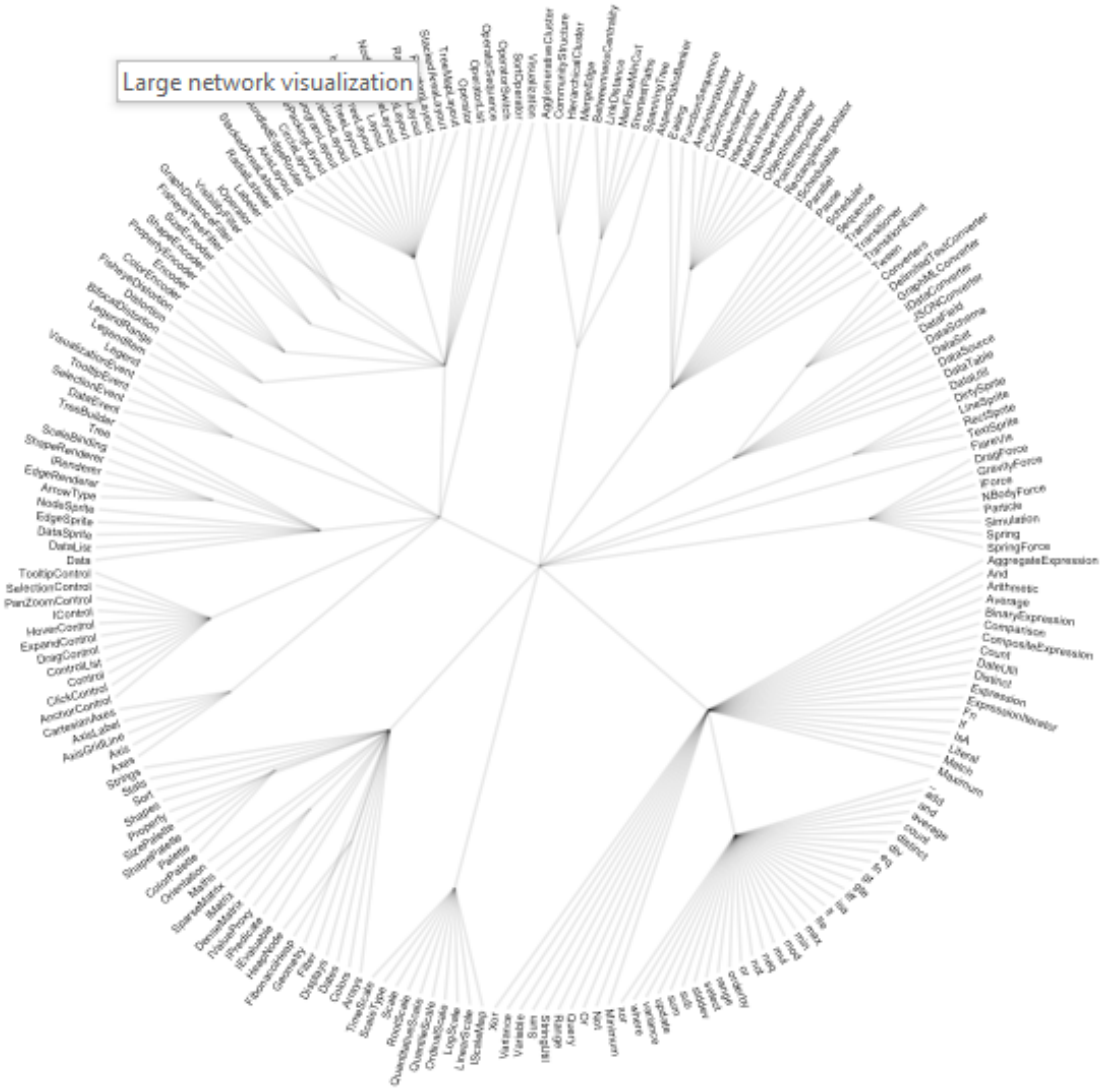


Network + Hierarchy = compound network

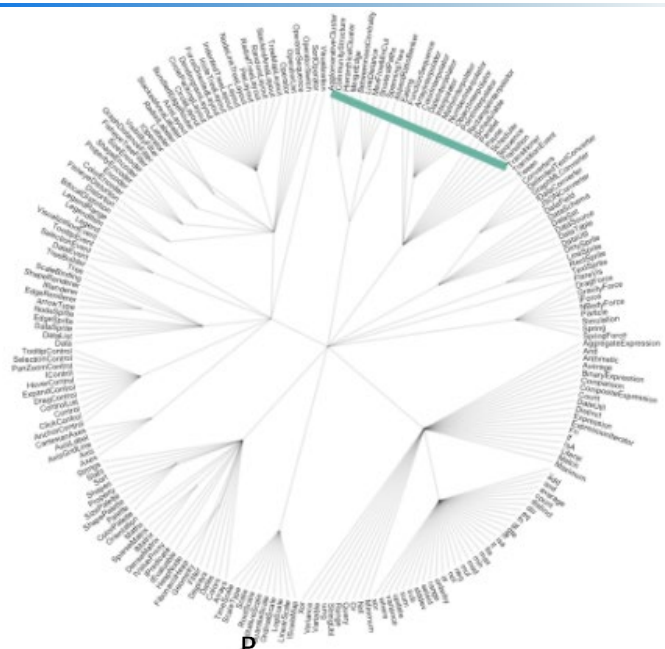
Hierarchical Edge Bundling[1]

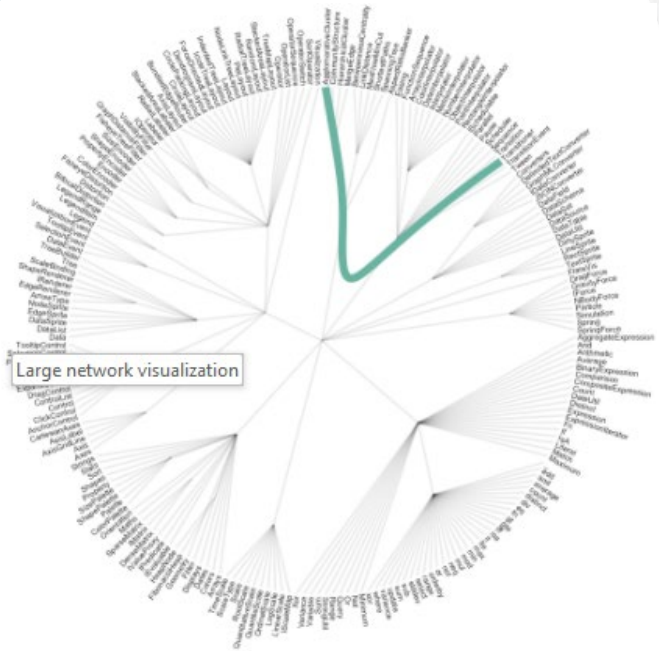
1. Holten, D. Hierarchical Edge Bundles: Visualization of Adjacency Relations in Hierarchical Data. *IEEE Trans. Vis. Comput. Graphics 12*, 5 (2006), 741–748.

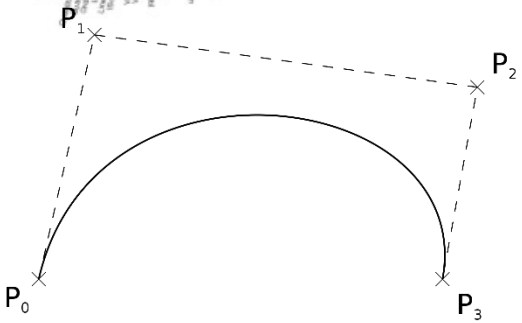
Large network visualization

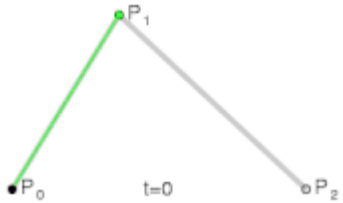


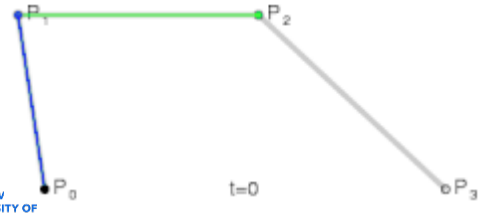
Large network visualization

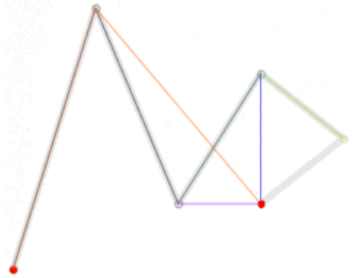






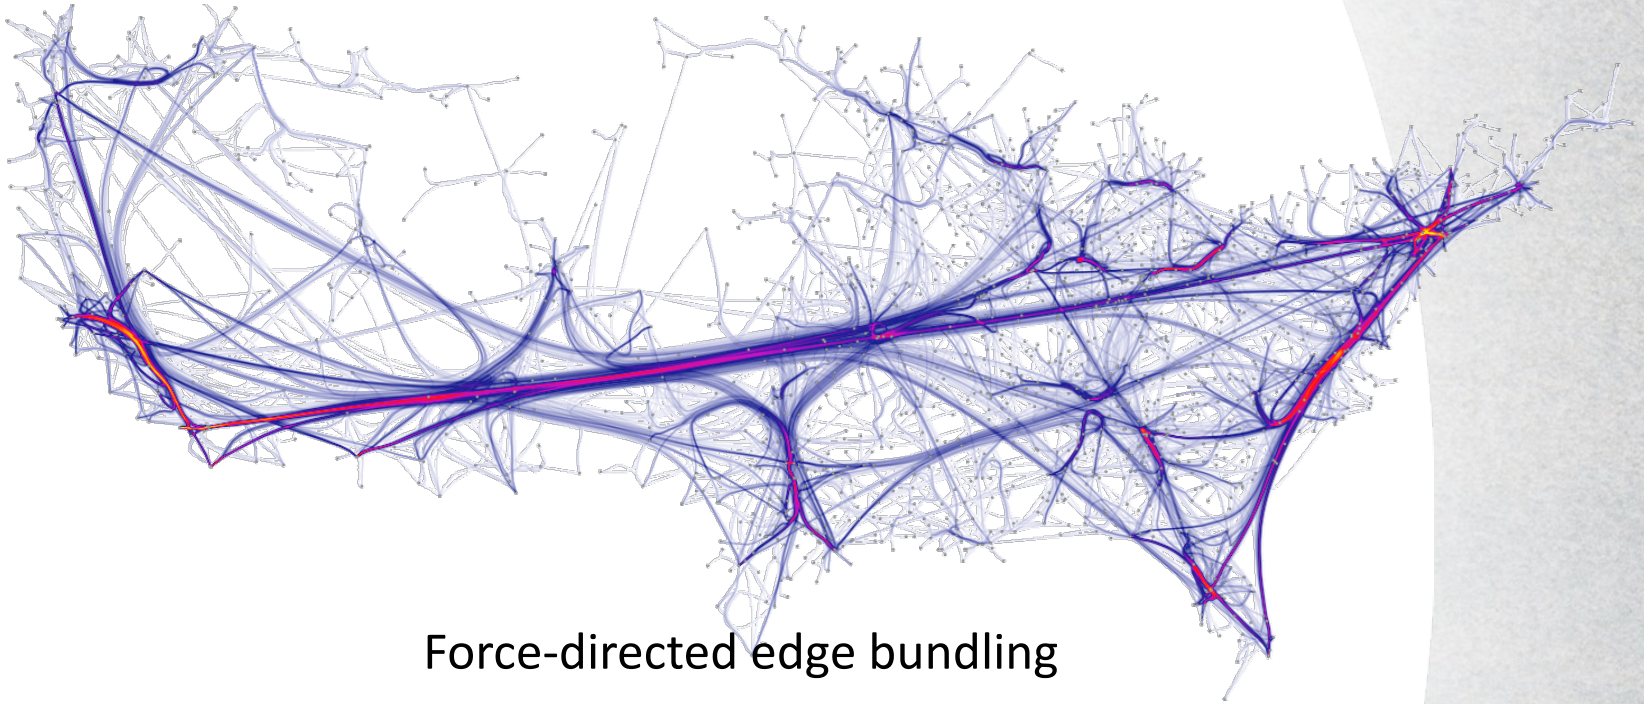




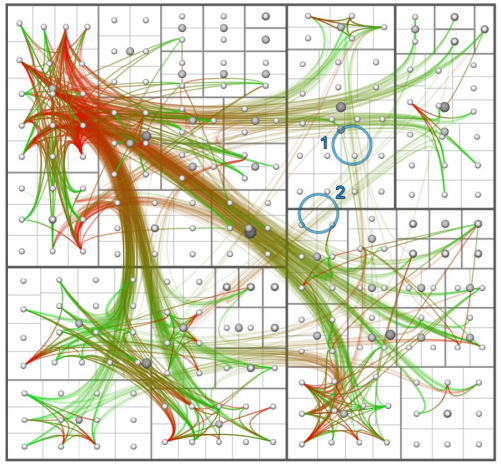


Bézier splines

Large network visualization

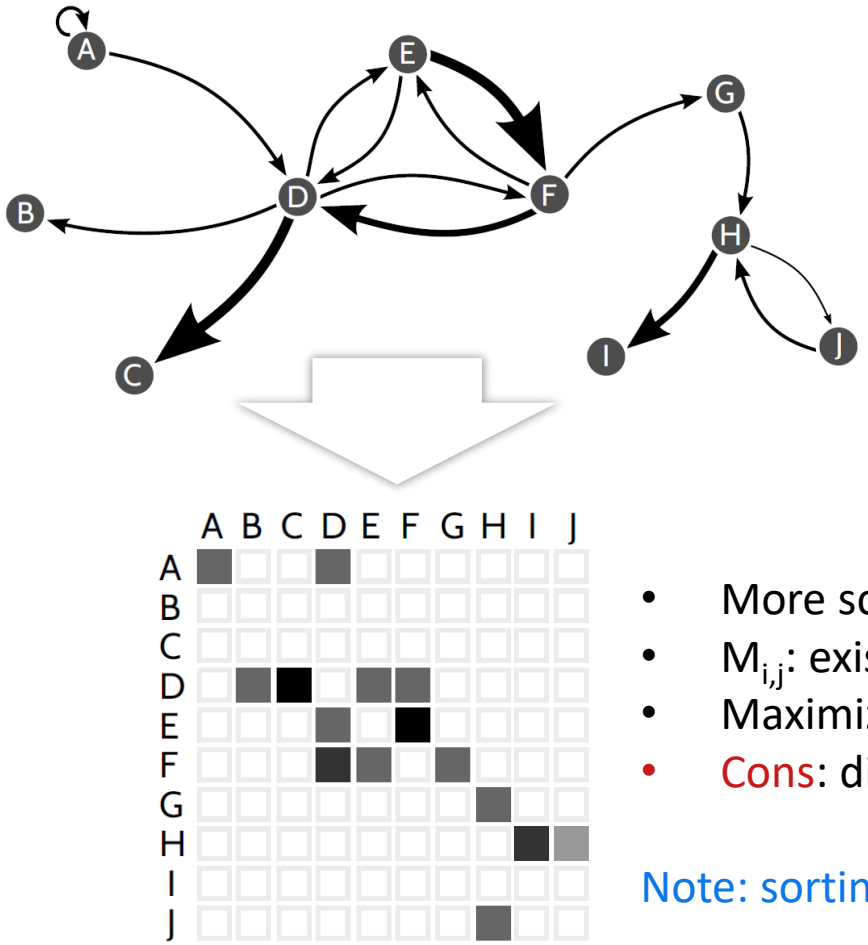


Force-directed edge bundling



Large network visualization

Visual Adjacency Matrix



- More scalable
- $M_{i,j}$: existance/weight of edge i → j
- Maximize edge visibility, no crossing edges
- Cons: difficult to see paths, motifs

Note: sorting extremely important

Large network visualization

Visual Adjacency Matrix

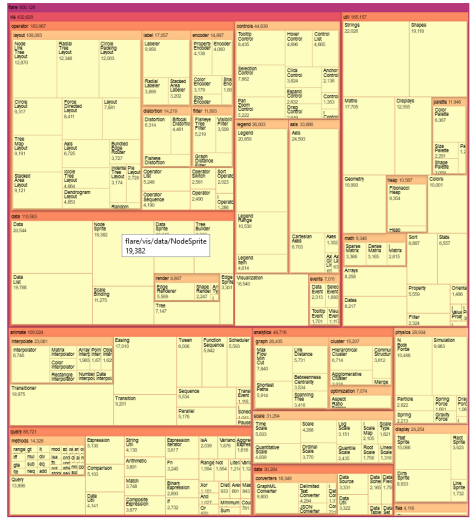
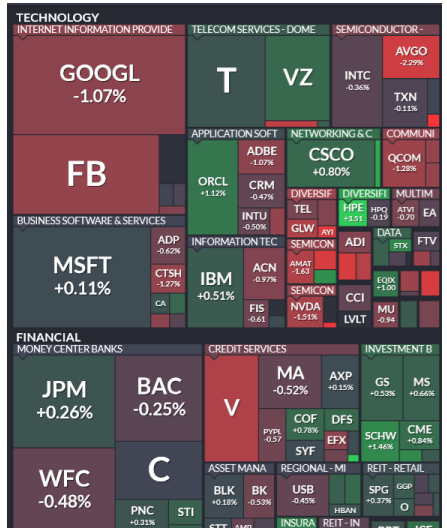
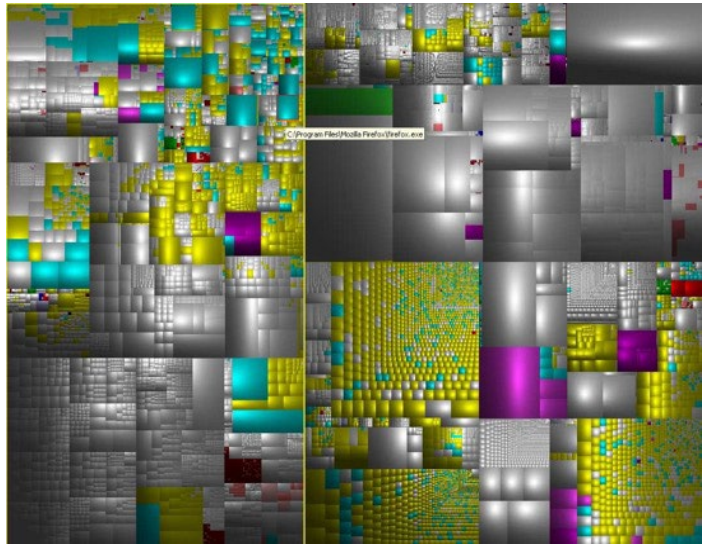
Treemap applications



https://observablehq.com/@d3/nested-treemap

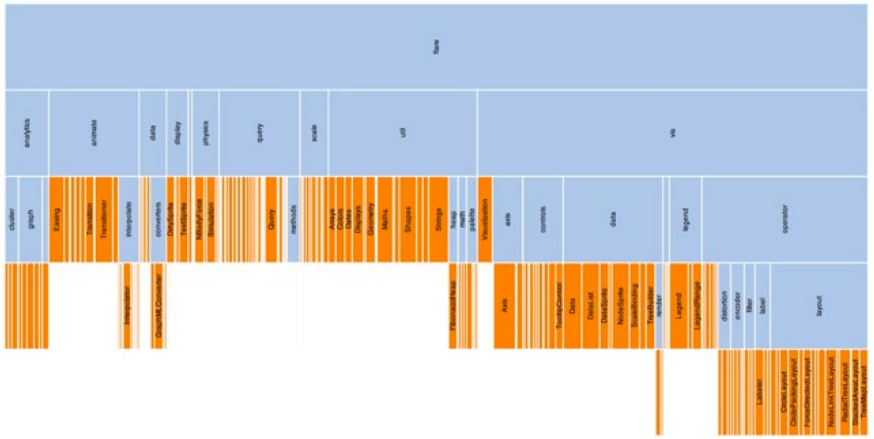


https://finviz.com/map.ashx

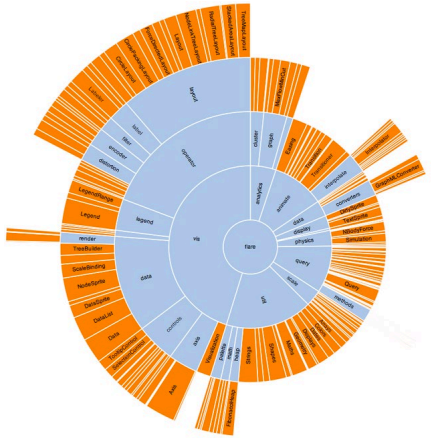


http://www.win.tue.nl/sequoiaview

Closely related



Icicle plot

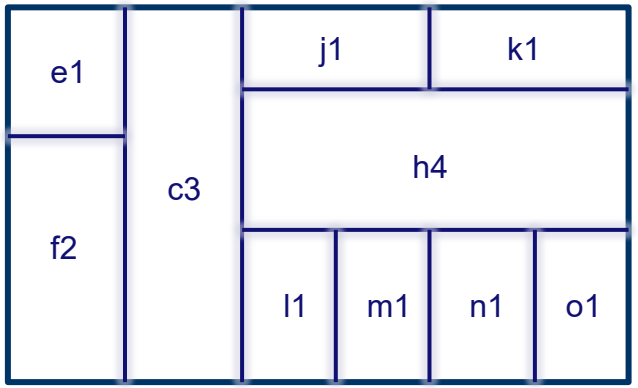


Sunburst diagram

- No overlapping parent child – attributes easier displayed
- Not as dense as Treemaps
- Better us of space compared to node-link trees

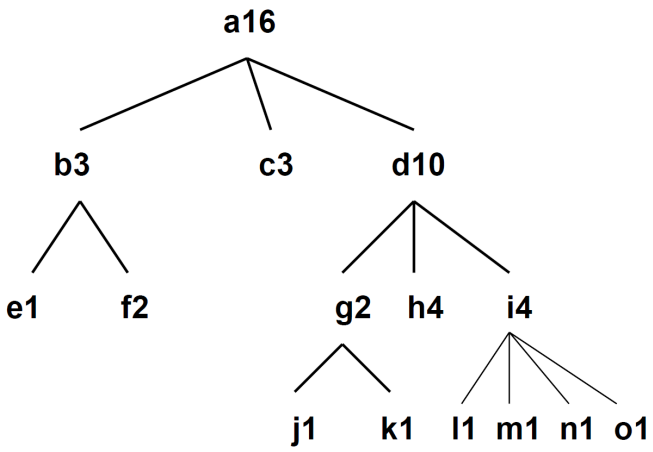
http://homes.cs.washington.edu/~jheer/files/zoo/

Node-link vs. Treemap



Treemap – Enclosure techniques

- Scalable: very good usage of available space – show attributes
- Difficulty in distinction of the hierarchy (implicit)



Node-link diagram

- Intuitive
- Good at exposing structure of information
- A lot of empty space

Useful resource

TU/e EINDHOVEN UNIVERSITY OF TECHNOLOGY

Visualization

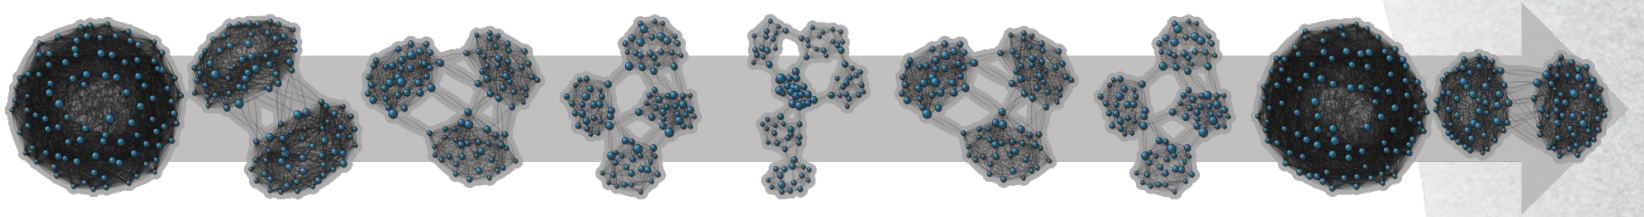
Graphs

Dynamic Networks

Dr.ir. Stef van den Elzen

Dynamic Networks

$$G = (V, E) \qquad E \subseteq V \times V \times T$$



Understand **dynamic** networks

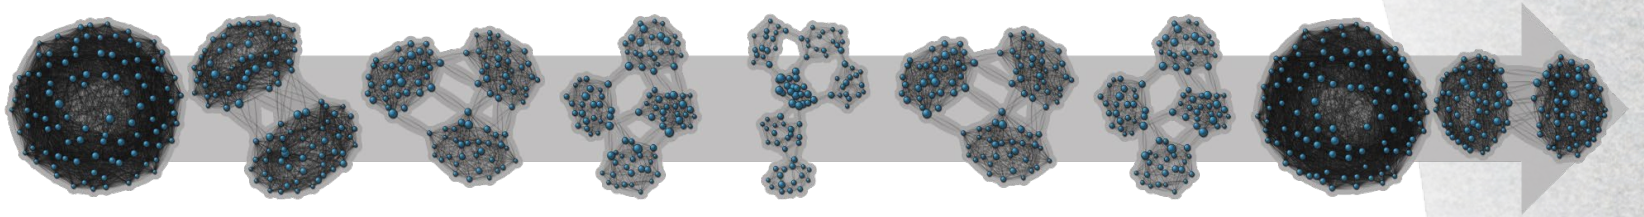
Structural properties
- Communities
- Motifs
- ….

Temporal properties
- Trends
- Periodicity
- Temporal shifts
- Anomalies
- ….

Discovery/exploration of states
- Characterizing the evolution of the network
- Stable states, recurring states, outlier states
- Transitions between them

Dynamic Networks

$$G = (V, E) \qquad E \subseteq V \times V \times T$$



Understand **dynamic** networks

Why not use automated methods?

e.g., #nodes, edges, degree distribution

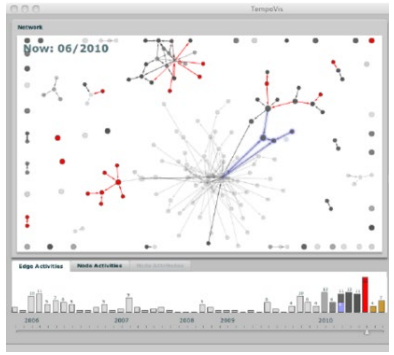
↓

High level summary of the network.

- Aggregation of results
- Loss of context
- No exploration possible (discover the unknown unknowns) → only confirm the expected.

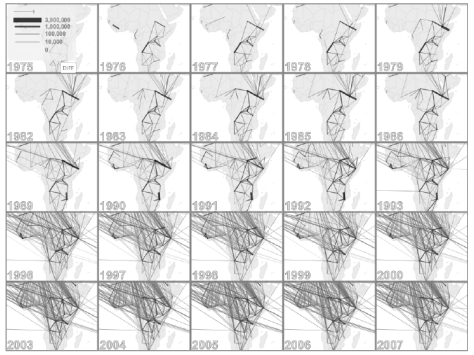
Dynamic Networks

time-varying network, time-stamped network, longitudinal network, evolving network, temporal network, ….



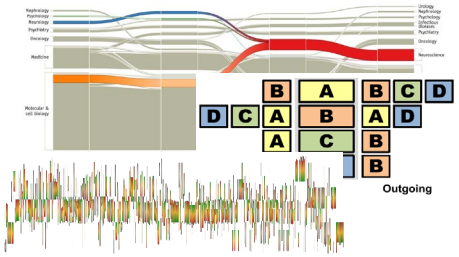
Animation

Map time to time



Small Multiples

Split time in intervals

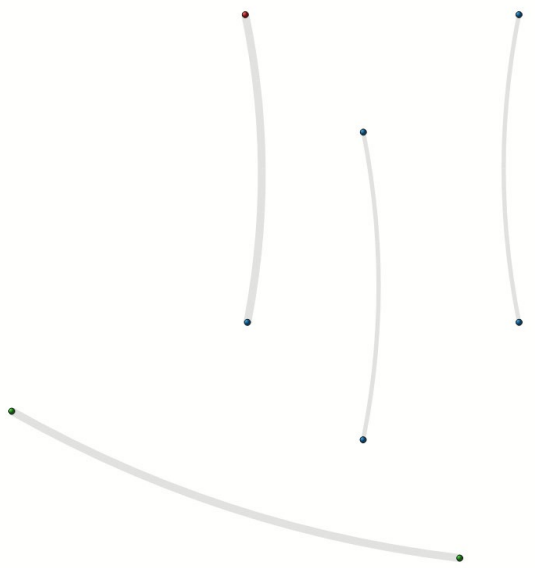


Integrated approaches

Map time to space

Animation

For each timestep compute layout



Improve:
Keep variation of the layouts as small as possible:
Preservation of the mental map

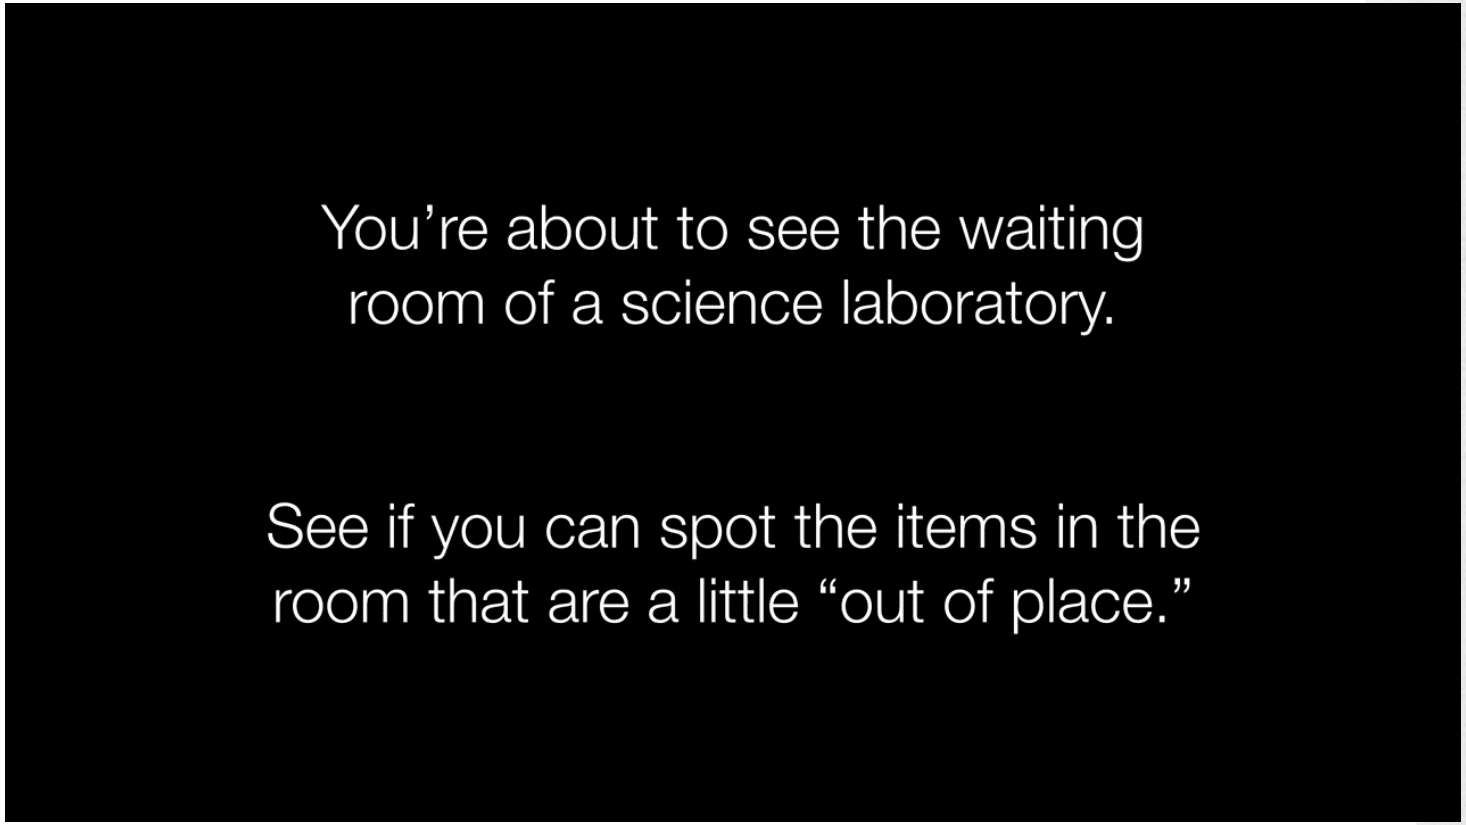
Aggregation (of time):
super-graph.

Add timeline control

Pros:
- Simple to implement
- Easy to spot big changes
- Applicable to all methods for which a single timestep can be visualized.

Cons:
- Need to focus on many moving or changing items simultaneously
- Keep track of (multiple) changes over longer time periods.
- Change blindness

Animation – Change blindness



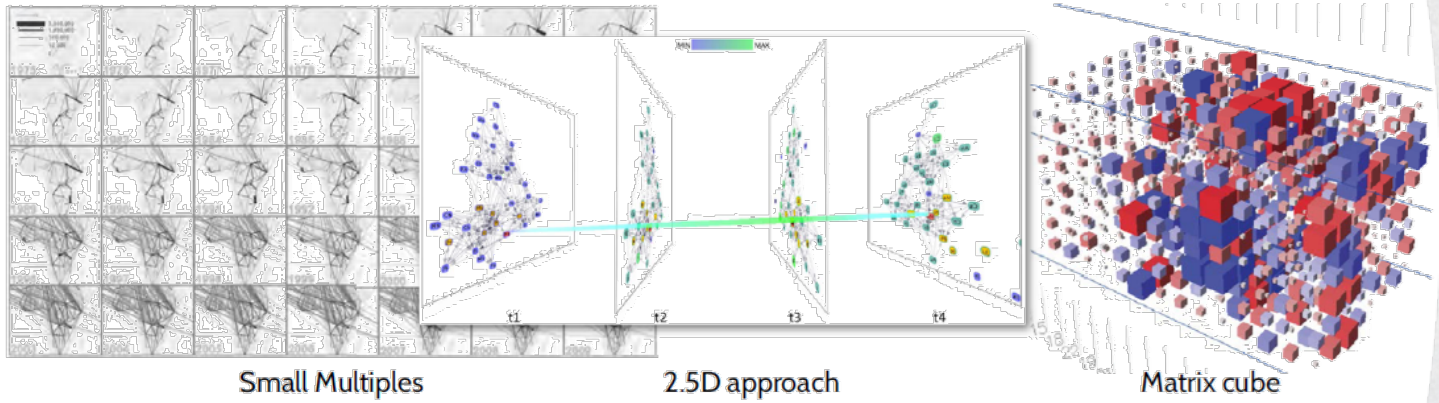
Eyes beat memory

For data comparison show images side by side
Do not use animation

https://www.youtube.com/watch?v=EARtANyz98Q&ab_channel=MichaelCohen

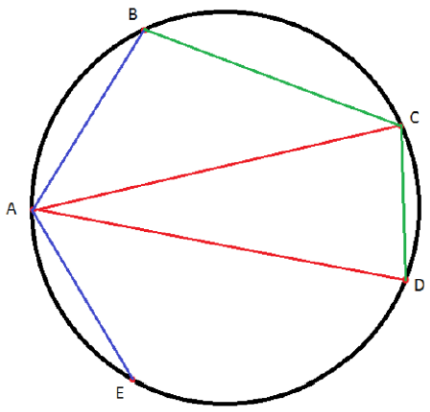
Small Multiples

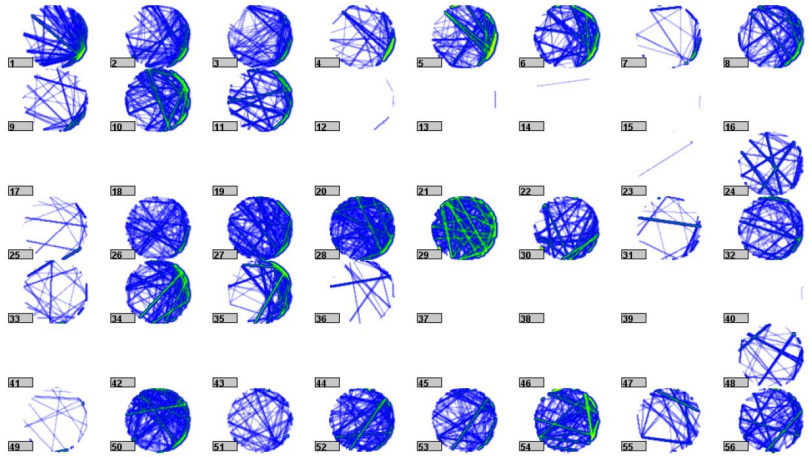
Juxtaposed visualizations using a filmstrip or grid layout.

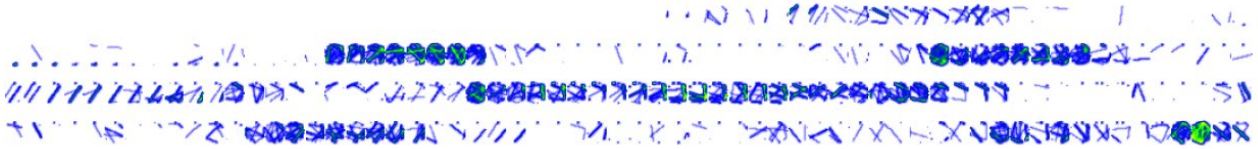


1. Boyandin, I., Bertini, E., and Lalanne, D. A Qalitative Study on the Exploration of Temporal Changes in Flow Maps with Animation and Small-Multiples.
2. Federico, P., Pfeffer, J., Aigner, W., Miksch, S., and Zenk, L. Visual Analysis of Dynamic Networks Using Change Centrality
3. Bach, B., Pietriga, E., and Fekete, J.-D. Visualizing Dynamic Networks with Matrix Cubes

Small Multiples







Pros:

- Independent of the visualization method used.

Cons:

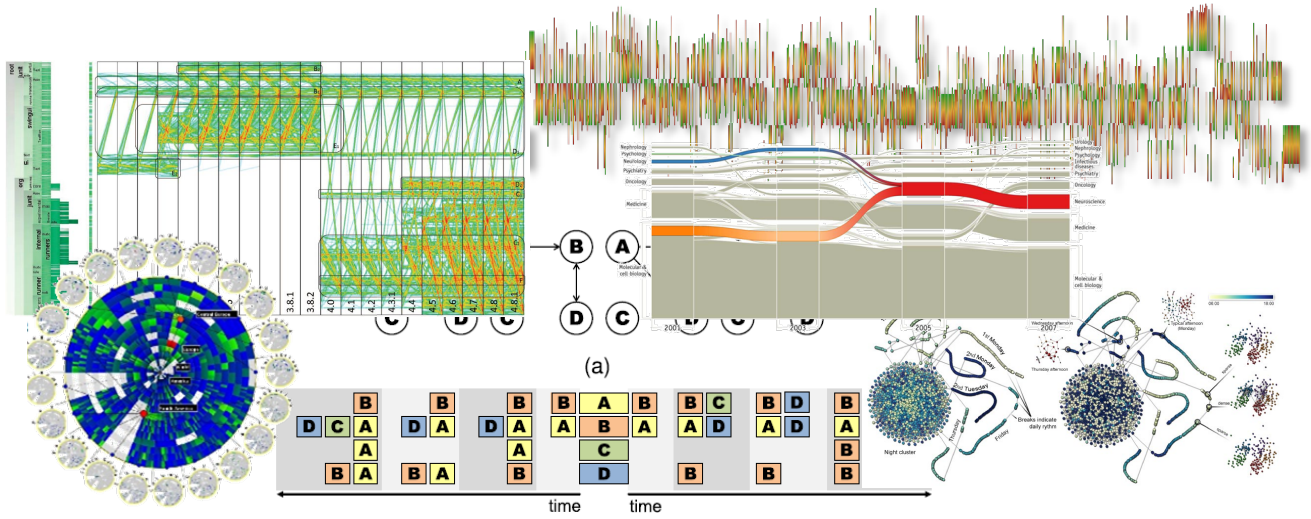
- Decide on the number of multiples to use.
- Limit on the number of multiples.
- Multiples might be far apart → difficult to spot patterns

1. Burch, M., Weiskopf, D., A flip-book of Edge-splatted Small Multiples for Visualizing Dynamic Graphs

Mapping time to space

Provide static overview of the entire time span of the network in one visualization.

Use automated method for analysis and/or visualization



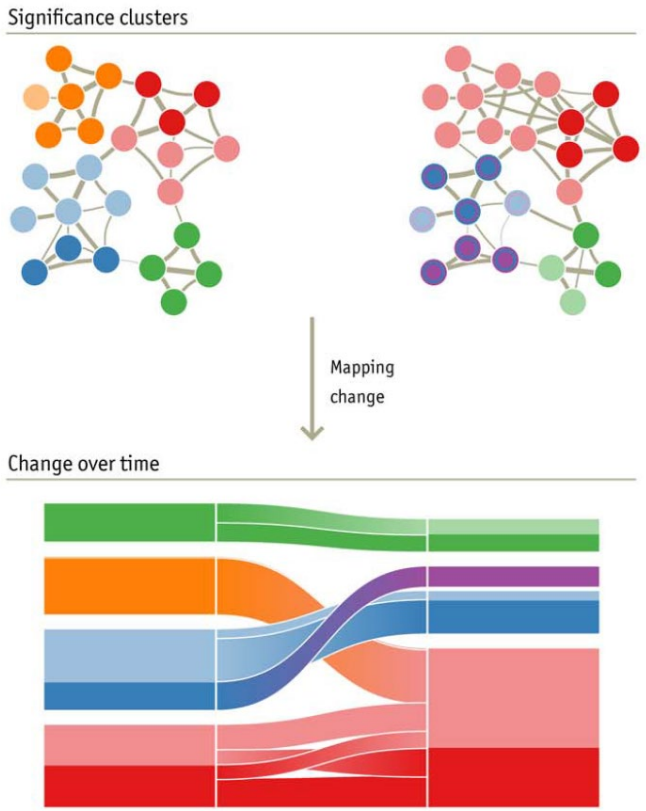
Pros:

- Complete overview of network is presented.
- Global patterns can be directly identified.

Cons:

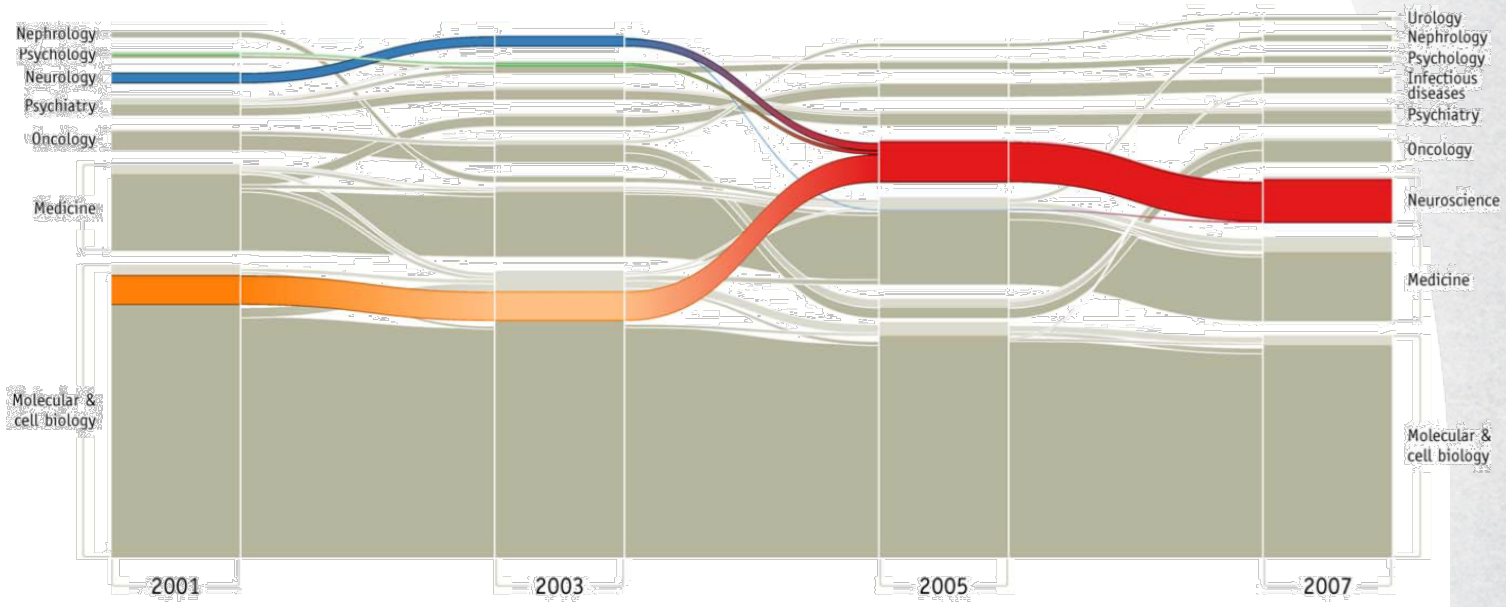
- Specialized visual encoding often difficult to interpret to non-experts.
- Often restricted to specialized type of network (acyclic, compound etc.)

Dynamic Networks – Clusters over time



Rosvall, M., and Bergstrom, C. T. Mapping Change in Large Networks. *PLoS ONE 5*, 1 (2010).

Dynamic Networks – Clusters over time



Visualization:

- Show entire timespan
- Scalable in both number of nodes and timesteps
- Individual nodes and edges not visible anymore.

Automated method:

- Cluster nodes and show change of clusters over time.

Rosvall, M., and Bergstrom, C. T. Mapping Change in Large Networks. *PLoS ONE 5*, 1 (2010).

Dynamic Networks – Massive Sequence View

From	To	Time	...
a	b	1	...
b	d	2	...
d	c	3	...
c	b	4	...
d	a	4	...
c	a	5	...
a	e	6	...
e	d	7	...

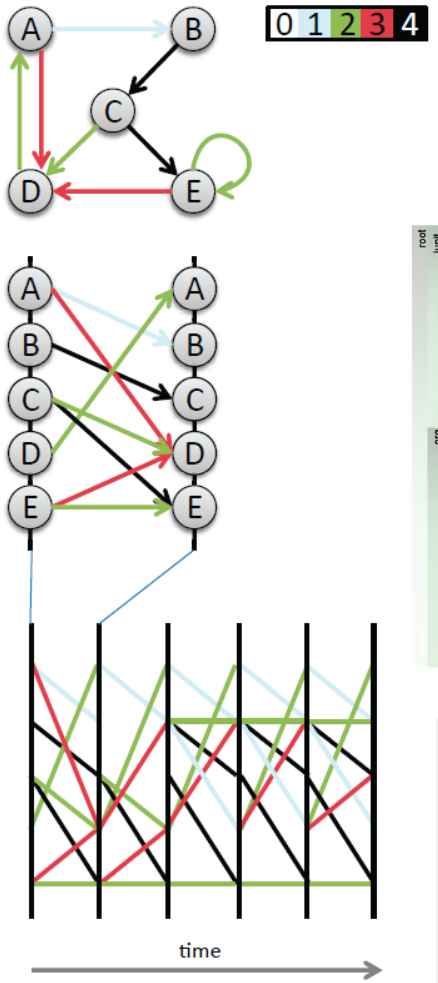
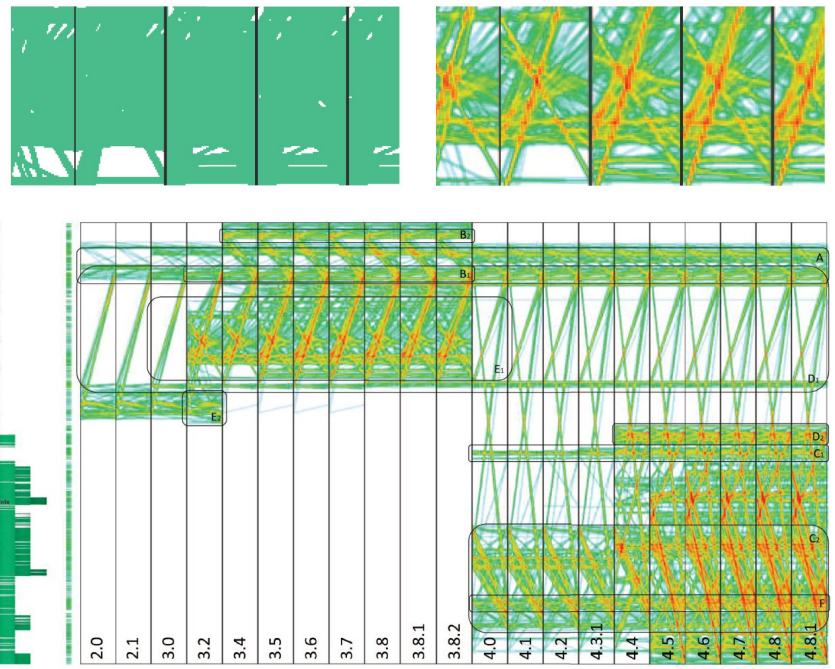
Dynamic Networks – Parallel Edge Splatting





Visualization:

- Scalable
- Needs interaction, filtering, zoom-pan.
- Difficult to see structure, communities

Automated method:

- Optimize layout to reduce clutter
- Density computation and normalization

M. Burch, C. Vehlow, F. Beck, S. Diehl and D. Weiskopf, "Parallel Edge Splatting for Scalable Dynamic Graph Visualization," in *IEEE Transactions on Visualization and Computer Graphics*, vol. 17, no. 12, pp. 2344-2353, Dec. 201.

Reduce snapshots to points

What if network becomes really large?

Discovery of states

- Stable
- Recurring
- Outlier

Transitions between them

Pros:

- Simple to implement
- Easy to spot big changes
- Applicable to all methods for which a single timestep can be visualized.

Cons:

- Need to focus on many moving or changing items simultaneously
- Keep track of (multiple) changes over longer time periods.
- Change blindness

Pros:

- Independent of the visualization method used.
- Eyes beat memory

Cons:

- Decide on the number of multiples to use.
- Limit on the number of multiples.
- Multiples might be far apart → difficult to spot patterns

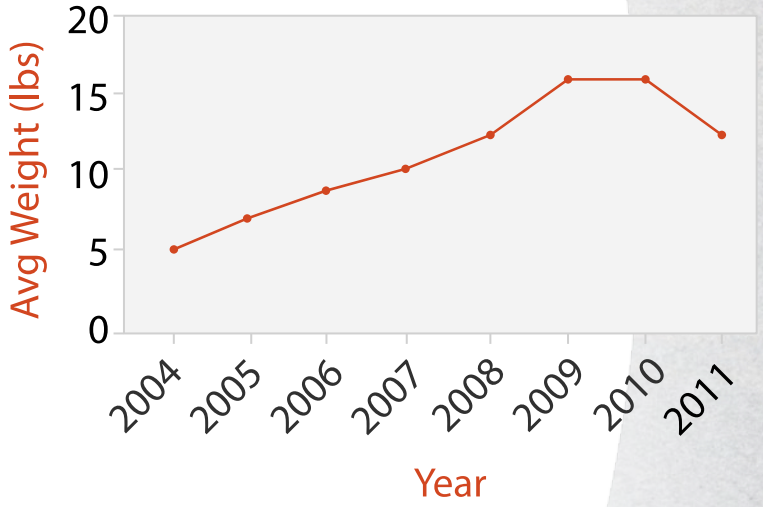
Line chart

Data:
- 2 Quantitative attributes
- One key, one value

Mark:
- Points, line connecting marks

Channels:
- Aligned lengths to express quantitative value
- Separated and ordered by key attribute into horizontal regions

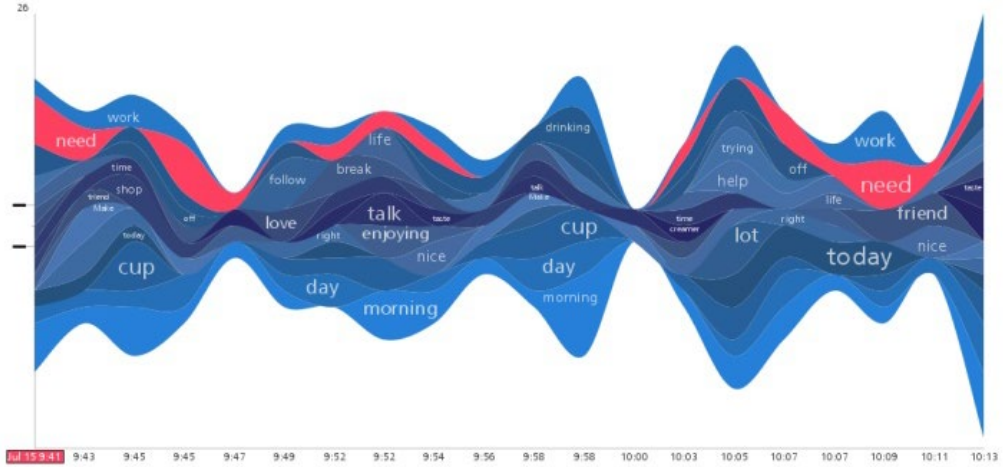
Tasks:
- Find trends
- Connection marks emphasize ordering of items along key axis → show relationship



Scalability? → Key attribute dozens to hundreds

Streamgraph

Generalized stacked graph
Emphasizes horizontal continuity



Data:

- 1 Categorical key attribute (names)
- 1 Ordered key attribute (time)
- 1 Quantitative value attribute (counts)

Marks & channels:

- Derived geometry: layers, height encodes counts.

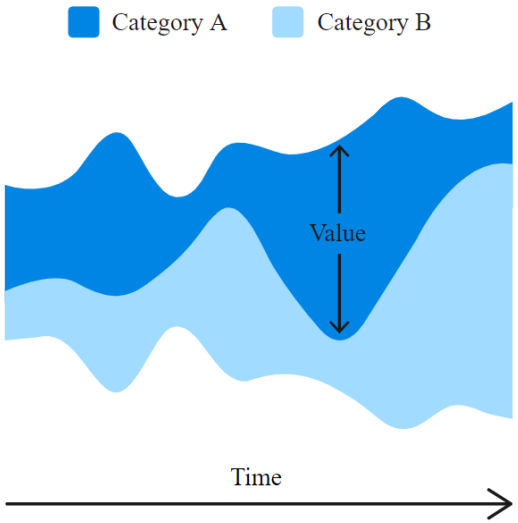
Tasks:

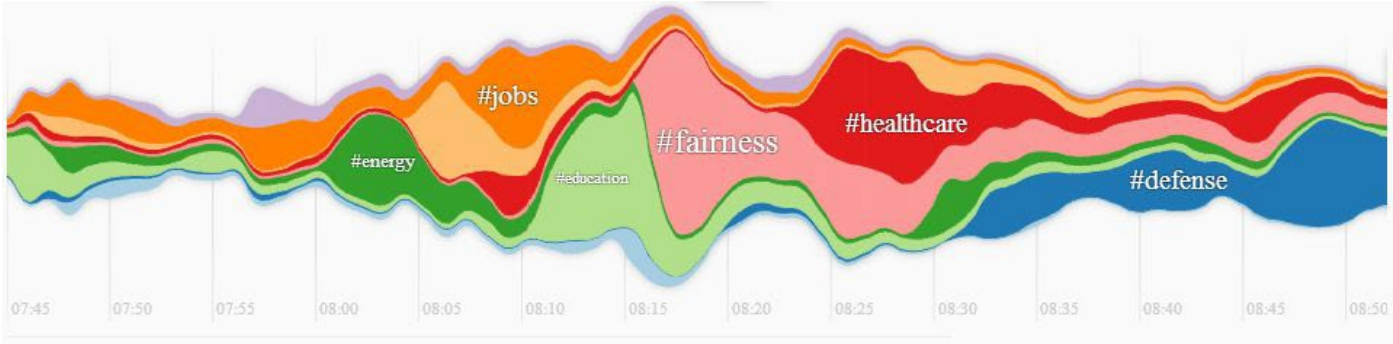
- Find trends, part-to-whole relationship

Scalability? → Hundreds of time keys
Dozens to hundreds of (names) keys

- More than stacked bars, since most layers don't extend across whole chart

Streamgraph

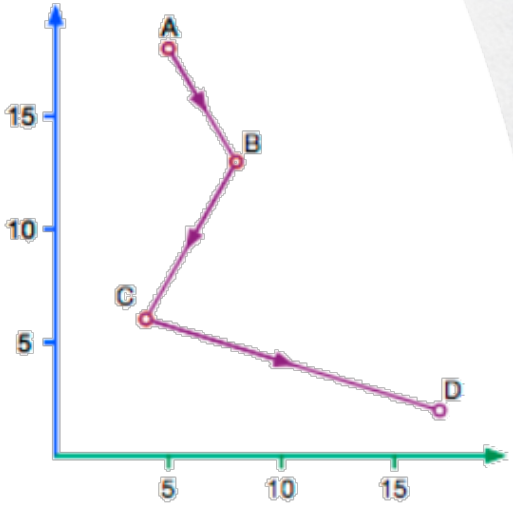




Connected Scatterplot

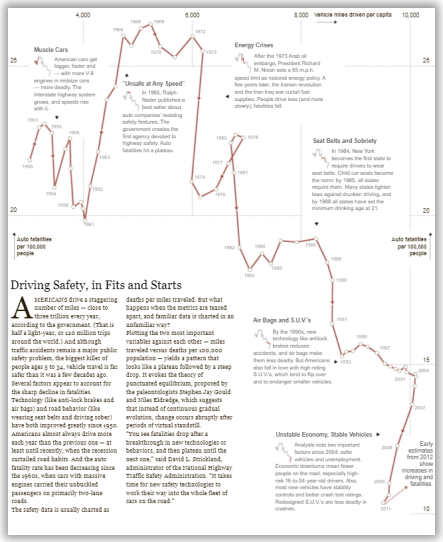
Scatterplot with line connection marks

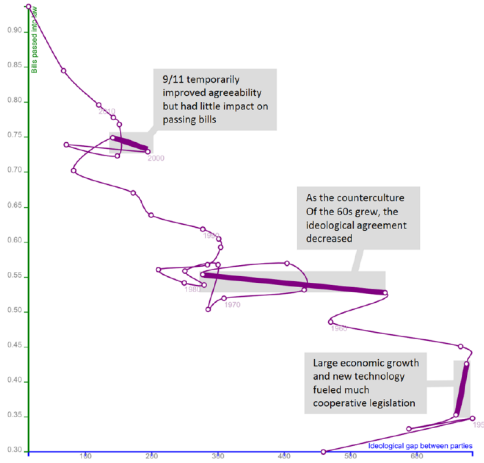
- Popular in journalism
- Horizontal + vert axes: value attributes
- Line connection marks: temporal order

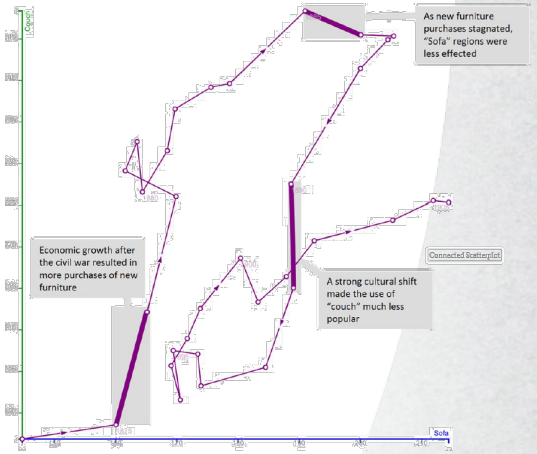


Empirical study results

- Engaging, but correlation unclear

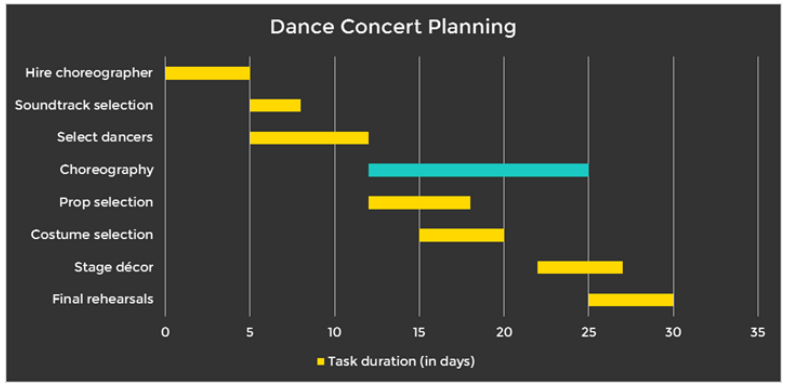






The Connected Scatterplot for Presenting Paired Time Series.
Haroz, Kosara and Franconeri. IEEE TVCG 22(9):2174-86, 2016.

Gantt chart



Data:
- 1 Categorical attribute
- 2 Quantitative attributes
- One key, two (related) values

Mark:
- Line, length duration

Channels:
- Horiz. Position: start/end times
- Horiz. Length: duration

Tasks:
- Emphasize temporal overlaps, start/end dependencies between items

Scalability? → Dozens of key levels, hundreds of value levels

Test on any users, informal usability study

Validate Lab study, measure human time/errors for task

Upstream: Different Strategies

Informal Usability Study

Validate Qualitative/quantitative result image analysis

Test on any users, informal usability study

***Quantitative**:* Measurable performance indicators

Quality metrics are specific to idioms.

Example: Graph Layout metrics – Node-link diagram

How many edge intersections?

Quality metrics effectiveness not always clear

Qualitative: non-measurable indicator

User experience and/or opinions

Heuristics exist to standardize process

The ICE-T method

“Evaluation” of the ***value*** of visualization

“[A measure of value] goes beyond the ability to support answering questions about data–it centers upon a visualization’s ability to convey a true understanding of the data, a more holistic broad and deep innate sense of the context and importance of the data in ‘the big picture’.”

J. Stasko. “Value-driven evaluation of visualizations.” In *Proceedings of the Fifth Workshop on Beyond Time and Errors: Novel Evaluation Methods for Visualization*, BELIV ’14, pp. 46–53, 2014.

Wall, Emily, et al. "A heuristic approach to value-driven evaluation of visualizations." *IEEE transactions on visualization and computer graphics* 25.1 (2018): 491-500.

Value Equation

Components

Insight | Time | Essence | Confidence

- T - A visualization's ability to minimize the total **time** needed to answer a wide variety of questions about the data
- I - A visualization's ability to spur and discover **insights** and/or **insightful questions** about the data
- E - A visualization's ability to convey an overall **essence** or take-away sense of the data
- C - A visualization's ability to generate **confidence**, knowledge, and trust about the data, its domain and context.

ICE-T Hierarchical Value Framework

COMPONENT
(ESSENCE)

GUIDELINES

The visualization provides a big picture perspective of the data

The visualization provides an understanding of the data beyond individual data cases

HEURISTICS

The visualization provides a comprehensive and accessible overview of the data

The visualization presents the data by providing a meaningful visual schema

The visualization facilitates generalizations and extrapolations of patterns and conclusions

The visualization helps understand how variables relate in order to accomplish different analytic tasks

ICE-T - Protocol

Enroll 5 participants

- Visualization users, not necessarily experts
- Not necessarily domain experts
- Must be familiar with the data used in the evaluation
- Arrangement with individual sessions

Set up the visualization(s) with some dataset(s)

- This method can also be used to compare different visualizations

“Teach” each participant the visualization

- … but let them explore it themselves. Tasks can be prepared start exploration (*unrelated* to design tasks)

Participants interact freely with the visualization(s)

ICE-T Results and Analysis

Record as much data as possible

- Interactions and voice

Participants rate the heuristics

- Likert scale, 1 (☹) -7 (☻)

Conclusions drawn from score average

- If the average score for a component is > 5, it is considered positive
- Positive evaluation for all components, evaluation is “passed”

Threats and Limitations

? Few users

? Responses might be biased towards a positive outcome

? Subjective interpretation of the heuristics

HCI developed multiple sound solutions:
Focus groups, field studies, and expert reviews

Some usability issues (e.g., difficult to exit a dialog box)
are often not interesting to Vis. research

Lab Study

Validate Lab study, measure human time/errors for task

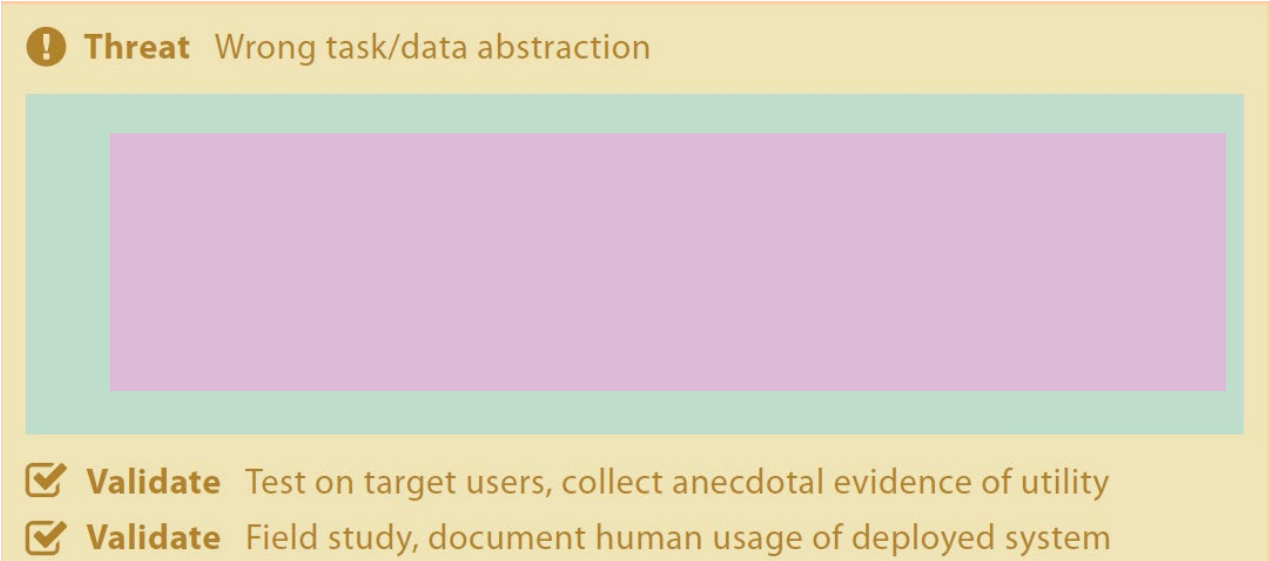
Quantitative: Performance/Accuracy of users

- Laboratory experiment in controlled conditions
- Allow strong conclusions
- Requires careful formulation of hypotheses
  Provides response only to the specific hypotheses
- Well-defined controllable tasks: Perception or cognitive tasks
- Experiment tasks should reflect hypotheses
- Requires sufficient number of participants to reach statistical significance
- Allows for comparison of multiple encodings

Qualitative: User experience and/or opinions

Requires a lot of effort and time – not always the best option

Data/Task Abstraction Validation



Downstream: Different Strategies

Field Study

Validate Field study, document human usage of deployed system

Threat: wrong task/data abstraction

- Misunderstood the user requirements
- Is the user able to solve the domain tasks?

Validation: Field User Study

- How people act in a real-world setting using the tool
- Can the experts integrate the tool in their workflow? Are the design tasks solved using the tool?
- How is the workflow changed after the introduction of a VIS tool?

Case-Study/Insight Based Evaluation

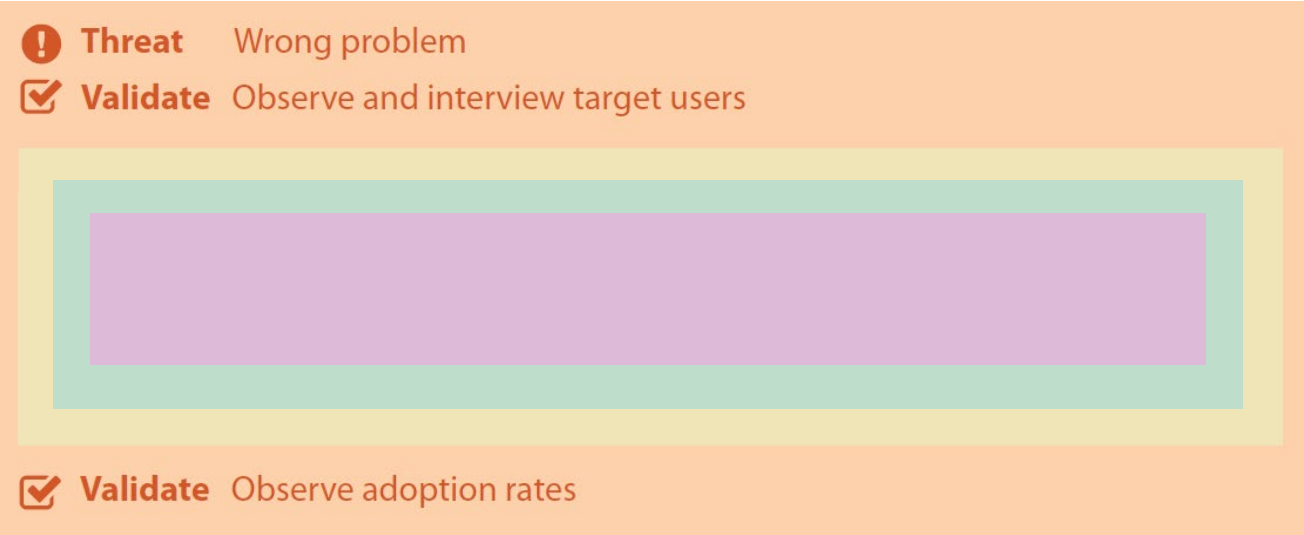
Validate Test on target users, collect anecdotal evidence of utility

Validation: Cases/scenarios where non-trivial discoveries can be achieved thanks to the visualization.

Test on target users collect anecdotal evidence of :

- Insights/discovery found
  (*Insight-based evaluation)*
- Hypothesis confirmed
- Hypothesis generated

Domain Validation



Downstream: Observe target users

Upstream: Measure adoption

Well designed is not always what is adopted

Empirical Studies in Information Visualization: Seven Scenarios

Heidi Lam, Enrico Bertini, Petra Isenberg, Catherine Plaisant, and Sheelagh Carpendale

Abstract—We take a new, scenario-based look at evaluation in information visualization. Our seven scenarios, evaluating visual data analysis and reasoning, evaluating user performance, evaluating user experience, evaluating environments and work practices, evaluating communication through visualization, evaluating visualization algorithms, and evaluating collaborative data analysis were derived through an extensive literature review of over 800 visualization publications. These scenarios distinguish different study goals and types of research questions and are illustrated through example studies. Through this broad survey and the distillation of these scenarios, we make two contributions. One, we encapsulate the current practices in the information visualization research community and, two, we provide a different approach to reaching decisions about what might be the most effective evaluation of a given information visualization. Scenarios can be used to choose appropriate research questions and goals and the provided examples can be consulted for guidance on how to design one's own study.

Index Terms—Information visualization, evaluation.
